VOL. I. NO. 4.

CLASSIFICATION OF THE SUPERFAMILY CHALCIDOIDEA.

By Wm. Harris Ashmead, A. M.

INTRODUCTION.

About fourteen years ago Mr. Herbert H. Smith placed in my hands for study part of his extensive collection of South American parasitic Hymenoptera, representing the old families *Proctotrypidæ*, *Cynipidæ* and *Chalcididæ*. The collection was a valuable one and when I took it I confidently expected to find time to finish with it within two or three years; but so much other material was thrust upon me for study that I found it a physical impossibility to do it justice in that length of time; only a few short papers on it have been published. The work accomplished during these past fourteeen years has I think fully demonstrated that I have not been idle, my knowledge of the groups, genera, and species of the Hymenoptera has greatly increased and broadened, and I now feel better able to do justice to the splendid collection received so many years ago.

The Herbert H. Smith collection of insects, made in South America, representing nearly all orders, has been acquired by the Carnegie Museum, Pittsburgh, Pa., and much to my regret, the many fine species, except a set of duplicates in my hands, and which I had always hoped might be secured by the National Museum, must go to that Museum. Dr. W. J. Holland, the Director of the Carnegie Museum, desires now that I complete my work as soon as possible and return the material in my possession. In acceding to this request I have stipulated that he publish my classification of the chalcid-flies, or the Superfamily Chalcidoidea, as a part of this work, and it is through his liberality that I am able to give so many fine illustrations and present in a more attractive form my ideas on the classification of another great complex in the Order Hymenoptera.

The *Proctotrypoidea* and *Cynipoidea* in the collection will be described in another paper.

In this contribution I have restricted myself to elucidating the chalcid-flies and have divided it into two parts. The first part is devoted to a classification of the superfamily Chalcidoidea; the second part deals with the South American Chalcidoidea. In this latter part, besides my report upon the Herbert H. Smith collection, the descriptions of the new genera and species, is given a complete bibliographical catalogue of all the known South American species.

PART I. CLASSIFICATION OF THE CHALCID-FLIES, OR THE SUPERFAMILY CHALCIDOIDEA.

Among the ten great groups or superfamilies of the Hymenoptera, recognized by the author, there is none so large numerically, more important economically, or so difficult to study and classify as the superfamily Chalcidoidea or the Chalcid-flies. The species exist everywhere not by hundreds, but by thousands and millions, and they are probably of far greater importance, from an economic standpoint, than are the Ichneumonoidea or ichneumon-flies.

Only a few of them, comparatively speaking, are in any sense injurious, a single minor group, the tribe Isosomini, in the family Eurytomidæ, alone being injurious to vegetation. All the others, except the fig-insects forming the family Agaonida, the Megastigmina, a subfamily in the Torymidae, and some few hyperparasitic genera in different families, being genuine parasites and beneficial to man. It is true, however, that some of the chalcid-flies destroy a few beneficial insects, but the vast majority of the known species destroy mostly the injurious species in the other orders, i. e., the Coleoptera, the Lepidoptera, the Diptera, the Rhynchota, etc.; they attack the eggs, the larvæ, and the pupæ, and in some cases even the imagoes of their hosts, and their value to many great industries of the world cannot easily be estimated. Who, for example, can estimate the value of the fig-insects to the fig industry of the United States? Through the efforts of Dr. L. O. Howard and Mr. W. T. Swingle, of the U. S. Department of Agriculture, the caprifier of the Smyrna fig, Blastophaga psenes Linné (grossorum Gravenhorst), has been successfully introduced into the fig-orchards of California, and the experiments already made fully demonstrate the great value this little chalcid-fly has to the fig industry. It is evidently destined to revolutionize fig-growing in the United States, making it exceedingly profitable, and, on account of the superiority of the American-grown

Smyrna fig pollenized by these Chalcid-flies, will in time diminish the importation of the Smyrna fig. The *Megastigminæ* too, I suspect, are like the figinsects, and will be found to be of great importance as pollenizers of various plants and trees.

At present the known genera and species of the Chalcidoidea are considerably less in number than are the Ichneumonoidea recently classified by the writer; but this is due simply to the fact that the literature on the subject, in various languages, is widely scattered, in many foreign journals, magazines, proceedings of learned societies, etc., and the minute size of most of the species and the difficulty of their study, have deterred entomologists from giving them any attention. Only a little over 5,000 species have been described.

If we look back for a century and a half we find comparatively few who have given much attention to these "atoms of creation," and of these a few names only stand out conspicuously as students of this great complex. The study of the group began about one hundred and fifty years ago with Linnæus in Sweden and with Geoffroy in France. Linné, or Linnæus, in his Systema Natura, tenth edition, published in 1758, described several species under his genera Ichneumon, Cynips, Sphex, etc. Others took up their study, and an interest in them was aroused in Sweden, Austria, Germany, France, Italy, and England. In Sweden, besides Linné, Swederus, Fabricius, Zetterstedt, Dalman, Boheman, Dahlbom and Thomson did much valuable work in the group; in Germany, Klug, Nees von Esenbeck, Bouché, Ratzeburg, and Förster—the last mentioned, the greatest systematic worker in the group; in Austria, Reinhard and Mayr; in Russia, Motschulsky; in France, Geoffroy, Latreille, Fonscolombe, Perty, Guérin, Giraud, Sichel, and André; in Italy, Spinola and Rondani; in England, Curtis, Haliday, Westwood, Walker, Saunders, Kirby, and Cameron; and in America, Say, Fitch, Cresson, Walsh, Riley, Provancher, Howard, and Ashmead. A few others might be mentioned, but those specified are the ones whose names stand out prominently as adding materially to our knowledge of the group during the eighteenth and nineteenth centuries.

For years I have been studying this great complex and in the following pages have attempted to define the families, subfamilies, tribes, and genera of the world. The work has been a gigantic and most laborious one, necessitating the microscopic examination of many thousands of these minute creatures; but if it shall be found that I have brought some order into their classification, that I shall excite an interest in the collecting of the many thousands still unknown, and that I shall stimulate others to study them, my time has not been wasted and I shall be amply repaid.

TABLE OF FAMILIES.

- Hind wings exceedingly narrow, linear, pedunculate at base; ovipositor issuing from beneath just anterior to tip of abdomen; antennæ without a ring-joint, the scape rather small, short, compressed..... 12
 Hind wings never very narrow, nor linear, not pedunculate at base; ovipositor issuing far anterior to the tip of abdomen; antennæ elbowed, with 1, 2, or 3 ring-joints, very rarely without, the scape large and rather long.
- 3. Head in φ oblong, with a deep, broad longitudinal furrow above, the occipital margin superiorly, usually with a small recurved tubercle or spine at its middle; mandibles or palpi most frequently furnished with saw-like appendages; anterior and posterior legs very stout, their tibiæ very much shorter than their femora, the middle legs very slender, sometimes aborted; hypopygium very

large, except in the *Cleonymidæ*, most frequently small, wedge-shaped, or linear and extending to base of front coxæ; if large and triangular, either the anterior or the posterior femora are much swollen; middle tibial spur not saltatorial, usually short or weak, never very stout. Hind tibiæ with 2 apical spurs, rarely with 1 only; in the latter case the radius termi-

4. Mandibles falcate, usually with 1 or 2 teeth within; thorax most frequently very gibbous, the scutellum usually very large, often abnormally developed, elevated and produced posteriorly, the axillæ connate, not distinctly separated from the surrounding surface and broadly united along their inner margins.

Mandibles usually 3-4-dentate at apex, rarely falcate, with 1 or 2 teeth within; thorax not, or very slightly, gibbous, the axillæ distinctly separate, their inner margins most frequently widely separated, very rarely touching.

Hind coxæ subtriquetrous, or at least compressed into a sharp ridge above; hind femora rarely very much swollen, and most frequently simple, rarely with one large tooth or denticulate beneath; hind tibia usually straight; abdomeu most frequently subcompressed (more rarely depressed), with a long ovipositor; if without an exserted ovipositor, the abdomen is conical or conic-ovate with a peculiar sculpture, the radius (stigmal vein) usually very short, the hind tibiæ at apex normal Family LXI. Torymidæ. Hind coxæ usually very long and subcylindrical; hind femora always much swollen and

Hind coxe usually very long and subcylindrical; hind femora always much swollen and most frequently armed with teeth beneath or finely serrated, rarely without teeth; hind tibiæ strongly curved and obliquely truncately produced at apex, so that the tarsi seem to be attached a little before tips; abdomen of various shapes, most frequently conical or conic-ovate, more rarely globose, or oblong-oval, the ovipositor very rarely prominent; radius variable, rarely very short...... Family LXII. CHALCIDIDÆ.

Pronotum large, quadrate or transverse quadrate, never very short, if somewhat shortened always as wide as the mesonotum.

- 7. Mesepisternum not large, triangular; anterior femora never much swollen, the posterior femora also normal or only slightly swollen; marginal vein in hind wings usually long, the costal cell not reaching to the hooklets or spinulæ and most frequently very narrow; radius well developed.

Family LXVI. MISCOGASTERIDÆ.

Mesepisternum large, triangular; either the anterior or the posterior femora are much swollen and sometimes toothed, or both are swollen with the hind femora toothed; if with slender legs, the hind legs are very long, their coxæ long, cylindrical, while the radius (stigmal vein) in front wings is very short, with the postmarginal vein very long extending to the apex of the wing (*Pelecinella*).

Family LXVII. CLEONYMIDÆ.

8. Mesonotum either depressed, with more or less distinct parapsidal furrows, the scapulæ longitudinally ridged, or convex or subconvex, entirely without furrows, rarely convex with distinct furrows; axillæ most frequently meeting at inner basal angles, rarely very widely separated.

Family LXVIII. ENCYRTIDÆ.

- 12. Pronotum usually large, rounded, or conically produced anteriorly; wings always with a long marginal fringe, nearly veinless and always without a radius (stigmal vein), the marginal vein most frequently reduced to a mere dot; antennæ in ♀ most frequently terminating in a distinct fusiform or egg-shaped solid club, more rarely with a 2-jointed club; tarsi 4-5-jointed.

Family LXXIII. MYMARIDÆ.

FAMILY LX. AGAONIDÆ.

- 1846. Agaonidæ, Family 6 (partim) Walker, List Chalc. Brit. Museum, I., p. 23.

- 1897. Agaonidæ, Family LX., Ashmead, Proc. Ent. Soc. Washington, IV., p. 243.

This family is one of the most striking and remarkable of any in the superfamily Chalcidoidea. It is based upon the genus *Agaon* Dalman, established in 1818, from a specimen taken in Sierra Leone, Africa.

The species composing this family, on account of their habits, curious forms, and the diversity of structure in the sexes, were long a puzzle to the ablest and most astute of the European hymenopterologists, but it is now definitely settled that they form a component of this great complex. Sir Sidney Saunders, as late as 1883, placed them as a division with the family *Cynipida*. In my opinion, however, they have little in common with the Cynipoidea, and I concur with Walker, Westwood, and Mayr, in believing them a component of this major group.

Mr. Francis Walker, an Englishman, was the first to give the group family rank; but, as is the case with most of his families, he never properly defined or characterized it, and merely lumped together a miscellaneous lot of insects obtained from figs, and called them a family—the Agaonide. His ideas of the family were extremely vague and indefinite, and he placed in it many forms with which they had no relationship.

In 1871, Walker, in speaking of them said: "The Agaonide appear as yet chiefly in three aspects, and in three different regions. The first region is the Mauritius, where they have been discovered by the researches of Dr. Coquerel. The three species figured are said to be 'condemned to eternal darkness' in the central regions of figs. These figs are the fruit of Ficus terragena and are unfit for human food. Dr. Coquerel found the three species (Apocrypta paradoxa, A. perplexa and Sycocrypta caeca) in abundance in the interior of these figs, together with great numbers of a fourth species, which he named Chalcis? explorator and which he believed to be parasitic on the other three species. Dr. Coquerel thought he saw an affinity between them and certain Bethylids, Scleroderma contractor, etc."

Walker thought they had more connection with certain South American and Australian *Thynnidæ*. He says: "Scleroderma seems to have more affinity with *Typhlopone*, the worker of Labidus, and with Dichthadia glaberrima, the supposed female of Dorylus; and thereby the multitudinous tribe of ants whose economy is

so remarkable, emerges from blind and radical Apocryptæ and Sycocryptæ, the perpetual dwellers in the interior of figs." "But the affinity of these two genera to the Chalcidiæ is more evident and appears by several connecting links in the Agaonidæ; and thus the near relation to the general ancestors of the thousands and perhaps tens of thousands of the Chalcidiæ species, the tribe being considered in unity, are cradled in figs."

Our knowledge of fig-insects, within the past twenty-five years, has been very greatly augmented by the studies of Prof. John O. Westwood and Sir Sidney Saunders, of England, Dr. Gustav Mayr, of Vienna, Austria, Dr. Paul Mayer, of the Naples Station, Italy, and my own studies on some Florida, Mexican and West Indies species, so that to-day sufficient forms are known in both sexes to enable me to segregate, define and place in their proper groups, the miscellaneous insects known as fig-insects.

In this work I have restricted the *Agaonidæ* to the caprifiers, or true fig-insects, chalcid-flies that live in and pollenize, or fructify, fig-trees.

The others, heretofore classified with them, belong elsewhere, in three or four different families, and are either inquilinous or genuine parasites. Some, the vast majority, belong to the *Torymidæ*, while others belong to the *Chalcididæ*, *Miscogasteridæ*, *Pteromalidæ*, etc.

All fig-trees, in a wild state, are diœcious and wherever fig-trees grow, principally in tropical and semi-tropical countries, there also will be found fig-insects, for these microscopic creatures are essential to their pollenization.

Undoubtedly, judging from the great number of fig-trees known to botanists, many genera and hundreds of species still remain unknown to us.

Among the genuine fig-insects, two well-marked subfamilies may be distinguished, separable by the aid of the following table:

TABLE OF SUBFAMILIES.

Abdomen in Q subcompressed, the ovipositor prominent, the mandibles with an appendage, usually serrate; males apterous, the abdomen long, narrowed towards apex and curving beneath the thorax.

Subfamily I. AGAONINÆ.

SUBFAMILY I. AGAONINÆ.

1883. Cynipidæ, Division I., Sycophagides (partim), Saunders, Trans. Ent. Soc. London, 1883, p. 20.

The males in this subfamily are easily distinguished from those in the next by the shape of the abdomen, which is always long and tubular, narrowed toward apex and never broadened at apex as in the *Sycophaginæ*. It is also more flexible and is usually curved or bent forward under the thorax.

The females are more difficult to separate and, although with practice one can detect a difference in cephalic characters, almost impossible to define, the only reliable character to separate them from those in the other subfamily is the mandibular appendage, which is usually finely serrate. In the *Sycophagina* the mandibles are always without an appendage.

The known genera falling in this group may be easily recognized by the use of the following table:

TABLE OF GENERA. 1. Females, always winged..... 3. Front wings with the marginal, stigmal and postmarginal veins fully developed, or at the most with Front wings without marginal, stigmal and postmarginal veins. Head oblong, about 1½ times as long as wide; antennæ 11-jointed, thickened toward apex. Eupristina Saunders (type E. masonii Saund.). Antennæ 10-jointed, the last five joints enlarged. Kradibia Saunders (type K. cowanii Saunders). Head oblong, or very long, from 21 to 3 times as long as wide, the facial channel narrow; mandibles at apex bidentate; antennæ 11-jointed Pleistodontes Saunders (type P. imperialis Saunders). 7. Head quadrate or nearly, only a little narrower in front than behind; stigmal vein usually a little 8. Seventh abdominal segment on each side with a small rounded or at most oval spiracular fovea. Blastophagus Gravenhorst (type Cynips psenes Linné). Seventh abdominal segment on each side with an elongate, disk-shaped, spiracular fovea. Ceratosolens Mayr (type C. appendiculatus Mayr). 9. Front wings with the marginal, stigmal and postmarginal veins wanting; head trapezoidal, a little longer than wide; antennæ 11-jointed, not thickened towards apex, the joints smooth; middle legs Front wings with the marginal, stigmal and postmarginal veins present; head oblong, 2½ times as long as wide; antennæ (?) 12-jointed, the scape large, triangularly dilated, the funicle slender, filiform, the club abruptly enlarged, 3-jointed; mandibles 3-dentate; thorax bidentate at each side. Agaon Dalman (type A. paradoxum Dalm.). 10. Head anteriorly with a large, deep, triangular fovea.

11. Front tarsi 2-jointed, the front and hind femora stout and more or less compressed; eyes very small Front tarsi 1-jointed, reposing in a sulcus at the tip of the front tibiæ; claws small, almost straight. Legs four, the middle pair aborted; antennæ 3-jointed, compressed; head and thorax subquadrate. Tetrapus Mayr. 13. The usually large antennal fovea terminates posteriorly in a narrow or broad longitudinal slit; if it does not, then the transverse oval antennal fovea does not extend to the middle of the head 14 14. Body somewhat narrow; antennæ 3- to 6-jointed. Front tarsi 5-jointed. Thorax in outline trapezoidal; antennæ 6-jointed, with 3 ring-joints. Pleistodontes Saunders. Thorax not so shaped, either bell-shaped or ellipsoidal, antennæ 3- to 6-jointed...... 15 15. Thorax not oblong, in outline either ellipsoidal or bell-shaped; antennæ 3- to 6-jointed. Thorax ellipsoidal, slightly contracted at the sides before the middle; antennæ 6-jointed, with Thorax bell-shaped; antennæ 3- or 4-jointed, with one ring-joint. Eupristina Saunders. 16. Head about twice as long as wide; front tarsi 2-jointed; antennæ 6-jointed......Ceratosolens Mayr. Head not or scarcely longer than wide, at the most not more than one and one half times as long as wide; front tarsi 3-jointed; antennæ 3-jointed. Head a little wider than long; tarsi of hind legs very long, more than twice longer than their

SUBFAMILY II. SYCOPHAGINÆ.

1883. Cynipidæ, Division II., Aploastomata, Saunders, Trans. Ent. Soc. London, 1883, p. 20.

This group was first correctly separated by Sir Sidney Saunders, who designated it as Division II., Aploastomata, in the family Cynipidx. It has, however, nothing to do with the Cynipidæ, but forms a natural group of the genuine fig-insects. At present no species is known outside of the Asiatic and African faunæ.

The females belonging to the group are distinguished from those in the previous subfamily principally by the absence of mandibular appendages. The head, however, is also somewhat differently shaped, being flatter, with a broader frontal sulcus and no hook-like tubercle on the middle of the occiput, while the abdomen is more depressed and the ventral valve is not prominent.

The males are more easily recognized, being quite different from those in the *Agaoninæ* and the wingless males in the *Torymidæ*. The head is very long and narrow, while the abdomen is long, sessile, and gradually broadened towards apex, each lateral apical angle being furnished with a tubercle, or a long, thread-like organ.

The genus Platyscapa Motschulsky I do not know, but, judging from Motschulsky's description, it seems to be one of these insects, and I have included it in my table with the hope that it may be rediscovered, and its proper position in our system definitely settled.

TABLE OF GENERA.
1. Females 2
Males 4
2. Postmarginal vein obsolete or nearly; maxillary palpi with rows of teeth along the under side 3
Postmarginal vein well developed, longer than the stigmal vein; maxillary palpi without rows of teeth
beneath.
Antennæ 13-jointed, with 2 ring-joints, of which the second is rather large; hind tibiæ with
rows of comb-like teeth at apex; stigmal vein not shortSycophaga Westwood
(type Cynips sycomori Hasselquist).
Antennæ 9-jointed (teste Motschulsky); hind tibiæ normal; stigmal vein short.
Platyscapa Motschulsky (type P. frontalis Motsch.).
3. Antennæ 11-jointed; hind tibiæ without rows of teeth at apex
(type C. triformis Mayr).
4. Apterous
Winged.
Postmarginal vein subobsolete; head with a large, deep triangular fovea anteriorly that extends
posteriorly to the middle of the head; antennæ 11-jointed
5. Head oblong, without a deep triangular fovea anteriorly; antennæ 3-jointed
Head nearly quadrate, a little wider than long, with a deep, triangular fovea anteriorly.
Antennæ 8-jointed, the scape thick, depressed; body broad Crossogaster Mayr.
6. Scape of antennæ about as broad as long; mandibles broad, 3-jointed; tarsal joints 2-4 wider than
long; abdomen terminating in two long filaments, one on each apical angleSycophaga Westwood.

Apocrypta Coquerel (type A. perplexa Coquerel).

FAMILY LXI. TORYMIDÆ.

Scape of antennæ long, subclavate, more than twice longer than thick; mandibles conical, without teeth; tarsal joints 2-4, not wider than long; abdomen not terminating in two long filaments.

- 1833. Torymidæ, Family II. (partim) Walker, Ent. Mag., I., p. 115.
- 1846. Torymidæ, Family I., Walker, List Chalc. Brit. Museum, I., p. 14.
- 1848. Torymidæ, Family I., Walker, opus. cit., II., p. 100.
- 1856. Torymoidæ, Familie XI., Förster, Hym. Stud., II., pp. 19, 23 and 43.
- 1875. Torymina, Tribus (partim) Thomson, Hym. Skand., IV., pp. 11 and 59.
- 1886. Toryminæ, Subfamily (partim), Howard, Ent. Amer., I., p. 198.
- 1897. Torymidæ, Family XLI., Ashmead, Proc. Ent. Soc. Washington, IV., p. 243.

This is a very large and most interesting family, approaching nearest, on one side, to the genuine fig-insects (Agaonidæ); on the other side exhibiting affinities that ally it to the Chalcidide, and some forms in the Miscogasteride and the Pteromalidx.

Many of the genera, especially in my subfamily *Idarninæ*, were included by Walker, Westwood and Mayr, among the *Agaonidæ*, a position not tenable. The genus *Podagrion* Spinola, too, on account of the swollen and dentate hind femora was placed by Mayr, Howard and others with the *Chalcididæ*. The swollen and dentate hind femora, although of great taxonomic importance, in themselves should not alone be depended upon to place genera and species. Many genera and species are now known with such femora that unquestionably belong to other families. In the family Cleonymidæ there is a whole subfamily with such hind femora and it would be absurd and most unnatural to classify it with the *Chalcididæ* on that account alone.

In establishing families many characters must be carefully considered, weighed and analyzed, and we should not be led astray by superficial resemblances or by characters common to many groups.

Six fairly well defined subfamilies have been recognized.

TABLE OF SUBFAMILIES.

1.	Mesothoracic furrows not well defined, the scapulæ therefore scarcely or indistinctly separated; abdomen in φ conically pointed, the ovipositor not exserted
	Mesothoracic furrows distinctly defined, the scapulæ therefore well separated; ovipositor always prominently exserted, most frequently very long
2.	Hind tibiæ with only one apical spur
4.	Posterior margin of the mesepisternum incised beyond the middle; metepimeron curved, dilated above the apex; posterior femora simple, neither armed with a tooth nor serrate
	Posterior margin of the mesepisternum entire; posterior femora rarely simple, more or less swollen, serrate or armed with one or two teeth beneath, sometimes much swollen and armed with several teeth beneath
3.	Stigmal vein always long; abdomen usually more or less depressed; if subcompressed the hypopygium is large and prominent; males frequently apterous, the head usually oblong, with a triangular fovea anteriorly in which lie the antennæ; abdomen short, never tubularly lengthened.
	Subfamily I. IDARNINÆ. Stigmal vein very short, the knob of same being sessile or subsessile; abdomen usually subcompressed, the hypopygium not prominent; males most frequently winged; if apterous, the head not oblong and without a triangular fovea anteriorly
4.	Hind femora not much swollen, as long as their tibiæ, beneath feebly serrate or armed with one or two teeth beyond the middle towards apex, their tibiæ straight; metanotum usually with a median carina, coarsely rugulose or punctate; stigmal vein not long, but still longer than in the Toryminæ, oblique and clavate
	Hind femora much swollen and armed with from four to eight teeth, their tibiæ arcuate; metanotum with a Λ-shaped carina; stigmal vein short, the knob subsessile, similar to the Toryminæ. Subfamily IV. Podagrioninæ.

SUBFAMILY I. IDARNINÆ.

1846. Agaonidæ, Family 6 (partim), Walker, List Chalc. Brit. Museum, I., p. 23. 1897. Idarninæ, Subfamily I., Ashmead, Proc. Ent. Soc. Washington, IV., p. 235.

All of the species composing this subfamily are found associated with the genuine fig-insects; they are either inquilinous or genuine parasites, as is the case in the *Cynipidæ* and the *Eurytomidæ*, and in at least another group in the Torymidæ, *i. e.*, the *Megastigminæ*.

The group comes nearest to the subfamily *Toryminæ*, agreeing with it closely in cephalic and thoracic characters, and in having two apical spurs on the hind tibiæ; but here the resemblance ceases, and it is easily separated by the difference in venation, shape of abdomen, etc.

The males are most frequently apterous, the head being long or oblong, with a triangular fovea anteriorly in which lie the antenne, a character also found in the Agaonidæ; but the abdomen is short and never tubularly lengthened nor broadened at the apex, as in that family.

The females agree somewhat with the *Agaonidæ* in venation, but differ decidedly in cephalic, mandibular, and abdominal characters, the abdomen being either depressed, *without* a prominent ventral valve, or subcompressed with a prominent ventral valve, with a long ovipositor. From the *Toryminæ* they are at once distinguished by the *long* stigmal vein and the different shape of the abdomen.

TABLE OF GENERA.

1.	Females 1
	Males
2.	Abdomen normal, the last two segments not tubular 2
	Abdomen abnormal, the last two segments very narrow and produced into a kind of tube or tail, the ovipositor very long
3.	Antennæ 10-jointed
	Antennæ 13-jointed, with three ring-joints; mesonotum with distinct parapsidal furrows.
	Seventh abdominal segment very long, longer than the preceding segments united; scape of
	antennæ scarcely thrice the length of the pedicel
	(type Cynips caricæ Hasselq.).
	Seventh abdominal segment hardly as long as the preceding segments united; scape of antennæ
	long, about four times as long as the pedicel Sycoscaptella Westw. (type S. affinis Westw.).
4.	Prothorax long, conical; metathorax long; legs short and stout, the front femora incrassated.
	Polanisa Walker (type Idarnes transiens Walk.).

5.	$\textbf{Scutellum} \ \textit{not} \ \textbf{flat}, \ \textbf{usually} \ \textbf{convex} \ \textbf{or} \ \textbf{at} \ \textbf{least} \ \textbf{subconvex}, \ \textbf{and} \ \textbf{usually}, \ \textbf{but} \ \textbf{not} \ \textbf{always}, \ \textit{without} \ \textbf{longitudinal}$
	grooved lines 6
	Scutellum flat and broad, quadrate, with two longitudinal grooved lines.
	Metallic; flagellum filiform, the joints of the funicle at least twice as long as thick; ocelli ob-
	tusely triangularly arranged
	Non-metallic; flagellum subclavate, the joints of the flagellum not or scarcely longer than
	thick; ocelli arranged nearly in a straight line
	(type K. australiensis Ashm.).
6.	Ovipositor shorter than the body and sometimes not at all prominent
	Ovipositor longer than the body; funicle of antennæ 5-jointed
7.	Abdomen with the ventral segments normal, not widened downwards
	Abdomen with the ventral segments widened downwards.
	Hypopygium very prominent, plowshare shaped; antennæ 12-jointed, with 2 ring-joints.
	Goniogaster Mayr (type G. variicornis Mayr).
8.	Mesothoracic furrows distinct, complete
	Mesothoracic furrows not distinct, wanting posteriorly.
	Antennæ 11-jointed, with one ring-joint inserted much nearer to the front margin of the head
	than to the middle; stigmal veiu long, nearly three fourths the length of the marginal.
	Sycoryctes Mayr (type S. patellaris Mayr).
9.	Antennæ 12-jointed or less
	Antennæ 13-jointed, with three ring-joints inserted at an equal distance between the middle and the
	front margin of the head; stigmal vein less than one third the length of the marginal.
	Trichaulus Mayr (type T. versicolor Mayr).
10.	Antennæ 12-jointed with one ring-joint; stigmal vein about half the length of the marginal.
	Apocryptophagus Ashmead, g. nov. (type Chalcis? explorator Coquerel).
	Antennæ 9-jointed (teste Motschulsky); abdomen elliptic, much depressed, the ovipositor twice the
	length of the body
11.	Postmarginal vein distinct, always present
10	Postmarginal vein wanting or never well developed
12.	Ovipositor hidden
10	Ovipositor always prominent or exserted
13.	Antennæ 12-jointed with two ring-joints, the funicle 5-jointed, inserted near the clypeus, the joints of
	the flagellum fluted; body metallic; ovipositor about as long as the thorax and abdomen united
	or a little longer, and thickened towards apex. Colyostichus Mayr (type Q C. longicaudis
	Mayr, & Heteradrium longipes Mayr).
	Antennæ 11-jointed with one ring-joint, the funicle 5-jointed, the club 3-jointed, the joints of the
	funicle hardly longer than thick; ovipositor scarcely as long as the abdomen, gradually thick-
	ened towards apex. Heterandrium Mayr (type of H. biannulatum Mayr, \$\varphi\$ Colyostichus brevicaudis
1.4	Mayr). Scutellum <i>with</i> two longitudinal grooved lines, the axillæ widely separated; ovipositor a little shorter
14.	than the abdomen
	Scutellum without grooved lines, the axillæ nearly uniting at base of scutellum; ovipositor only
7 F	slightly projecting
15.	Mesothoracic furrows indistinct, never complete; antennæ 9-jointed.
	Micranisa Walker (type Idarnes pteromaloides Walk.).

	ASHMEAD: CLASSIFICATION OF THE CHALCID FLIES	239
16.	Tarsi 5-jointed.	. 17
	Tarsi 3- or 4-jointed	. 31
17.	Apterous or with rudimentary wings	18
	Winged	. 34
18.	Antennæ inserted on the anterior margin of the head or far below its middle; clypeus not exten	ding
	to the middle of the inner margin of eyes	. 19
	Antennæ inserted on the middle of the face	30
19.	Head anteriorly with a large, deep, triangular fovea from which originate the antennæ	. 20
	Head anteriorly without such a fovea; wings entirely absent, not represented by filaments	. 25
20.	Wings represented by two pairs of thread-like filaments	. 21
	Wings represented by one pair of thread-like filaments or by bristles	. 22
21	Head oblong, not or scarcely wider than the thorax, the eyes minute; antennæ separated by a s	sharp
	carina; hind tarsi with the first joint dilated	rster.
	Head large, oblong, slightly narrowed anteriorly, the hind margin sinuate, the hind angles roun	nded
	setose; antennæ 8- or 9-jointed with 1 ring-joint, the scape large, clavate; mandibles large, por	rect
	curved, acute and entire at apex, but within, 3-dentate.	
	Tetranemopteryx Ashmead, g. nov. (type Sycoscapter 4-setosa Wes	tw.)
22.	Head oblong, the hind angles rounded, not acute	. 23
	Head oblong-quadrate, the hind angles acutely produced, not rounded	24
23.	Head large, oblong, broader than the thorax; antennæ 10-jointed, $with\ 1$ ring-joint inserted	close
	together near the front margin of the head; mandibles porrect, stout and curved, the tips a	
	entire, the inner margin with a tooth behind the middle Sycoscapter West	
	(type S. insignis Wes	
	Head oblong-quadrate, sinuate posteriorly; antennæ 8- or 9-jointed, without a ring-joint, inserted	
	together near the mouth; mandibles porrect, falcate, the tips bidentate, the inner margin w	
	tooth near the base Sycoscapteridea Ashmead, g. nov. (type Sycoscapter monit	
24.	Head oblong, the sides anteriorly nearly straight, the front angles rounded, the hind angles ac	
	produced; antennæ 8-jointed (or 9-jointed with 1 ring-joint), inserted close together near the mo	outh
	mandibles small, falcate, entire; wings represented by short filaments.	
	Sycoscapterella Ashmead, g. nov. (type Sycoscapter anguliceps Wes	
25 .	Antennæ shorter, at the most 9-jointed, the joints closely united, inserted further from each other	
	to the sides of the head, most frequently with only 4 or 5 free joints	
	Antennæ longer, 10- or 11-jointed, with only the last three joints closely united, inserted near of	
	far away from the mouth border	
26.	Head between the clypeus and the sides concave; mandibles bidentate; labium and palpi wantin	
	place is a membranous tube; antennæ composed of 4 free joints, of which the third is s	
	annular, transparent and membranous	
	Head between the clypeus and side flat; mandibles 3- or 4-dentate; labium and labial palpi pre	sent
	the palpi 1-jointed; tibiæ short, closely and thickly spinous; antennæ with 4 or 5 free joints.	
	Head depressed, wider than long, but not perfectly flat, more or less triangular, the a	
,	rounded	
	Head perfectly flat, longer than wide, trapezoidal; mandibles broad, 4-dentate wi	
-	antennæ 5-jointed, the scape flat, dilated towards apex	
27.	Head more or less depressed; tarsi 5-jointed, the basal joint of hind tarsi often much compressed	iand

with very long bristles.

	Hind tarsi much longer than their tibiæ, the basal joint long
	Hind tarsi not longer than their tibiæ, the basal joint short
28.	First joint of flagellum smaller than the second; mandibles bidentate; hind tibiæ with several very long bristles, the first joint two thirds the length of the tibia
	First joint of flagellum much longer than the second; mandibles unidentate at apex; hind tibiæ with
	out long bristles
29.	First joint of the flagellum only a little longer than the second and not much longer than thick; man, dibles very long, strong and toothed within; hiud tibiæ with short stiff bristles; all joints of tars slender; pronotum very large, quadrate, larger than the meso- and metanotum united. Goniogaster Mayr.
30.	Head large, sinuate anteriorly and posteriorly, and also with the lateral margins posteriorly incised so as to form a tooth just before the hind angles; wings represented by a pair of thread-like filaments antennæ 10-jointed, with 2 ring-joints, inserted widely apart or laterly close to the eyes, the scape very large, dilated, quadrate above, rounded basally, and beneath at base deeply incised; mandibles
	robust, triangular, curved, the tips bifid, within towards base produced and tridentate. Sycobiella Westwood (type S. saundersii Westw.).
	Head large, transverse ellipsoidal, sinuate anteriorly, rounded posteriorly, the hind angles rounded wings entirely wanting; antennæ 9-jointed, with 1 ring-joint, inserted on the middle of the face.
	much nearer together than to the inner margin of the eyes, the scape very large, dilated, clavate mandibles long, porrect, the tips bidentate, dilated towards base, the dilation being tridentate. Walkerella Westwood (type W. timeraria Westw.).
31.	Tarsi 4-jointed; wings represented by thread-like filaments
32.	Head oblong-quadrate, emarginate or sinuate anteriorly and posteriorly; occili absent; antennæ 8- or 9-jointed, without a ring-joint, inserted far above the middle of the face, the scape large, dilated, clavate; mandibles large, porrect, nearly as long as the head, curved, the tips bifid, the inner margin armed with a tooth near the middle or sometimes truncate.
33.	Otetesella Westwood (type O. digitata Westw.). Antennæ 9- to 11-jointed (the club sometimes 3 joints), with one ring-joint, shorter than the head and inserted close together near the mouth, the scape large, depressed, subclavate; mandibles small, acute, slightly curved, without teeth within Sycoscaptella Westwood (type S. affinis Westw.).
34.	Postmarginal vein distinct, well developed
35.	Second joint of the funicle not shorter than the first
36.	Antennæ 12-jointed, with 2 ring-joints; pronotum long
	not ending in little teeth
37.	Postmarginal vein longer than the stigmal; mandibles not long, falcate, 2- or 3-dentate; antennæ 11- 12-jointed, the club not much thicker than the funicle; pronotum subquadrate, a little wider at the middle than before or behind; scutellum large, subconvex, the parapsidal furrows very fine, but distinct

ASHMEAD: CLASSIFICATION OF THE CHALCID FLIES 241 Postmarginal vein not longer than the stigmal; mandibles very long, falcate, bidentate at apex; antennæ 11-jointed; pronotum very long, rounded in front; scutellum 38. Stigmal vein rather short, less than one third the length of the marginal; antennæ 13-jointed, with 239. Antennæ 13-jointed, with 2 ring-joints; mesonotum with distinct parapsidal furrows. Pronotum quadrate, a little narrower than the mesonotum; scutellum with two grooved lines; abdomen oval, subdepressed, much shorter than the thorax, briefly petiolate, and terminating Pronotum large, rounded anteriorly; scutellum without grooved lines; abdomen compressed, SUBFAMILY II. TORYMINÆ. 1840. Pteromalides, Subfamily (partim) Westwood, Intro. Mod. Class. Ins., II., Synop., p. 67. 1846. Torymidæ, Family 4 (partim) Walker, List. Chalcid. Brit. Museum, I., p. 14. 1871. Torymides, Subtribus (partim) Thomson, Hym. Skand., IV., pp. 59, 64.

1899. Toryminæ, Subfamily II., Ashmead, Proc. Ent. Soc. Washington, IV., p. 247.

The vast majority of the species falling in this group are parasitic on gall-inhabiting insects, belonging to the orders Hymenoptera and Diptera, although others are recorded as having been bred from Coleoptera, Lepidoptera, etc., and from the nests of bees and wasps.

I think it quite likely these latter records are erroneous, and that the Coleoptera, Lepidoptera, etc., had dipterous parasites from which the torymines came.

TABLE OF GENERA.

1.	Females	2
	Males	8
2.	Antennæ 13-jointed, with only one ring-joint	3
	Antennæ 13-jointed, with two ring-jointsLochites Förster (type L. papaveris Förster	·).
3.	Scutellum without a cross-furrow before apex	4
	Scutellum with a cross-furrow before apex.	
	Abdomen with second dorsal segment incised medially at apex.	
	Syntomaspis Förster (type Torymus cyaneus Bohemar	ι).
4.	First joint of flagellum not abruptly narrower than the following; clypeus at apex truncate	5
	First joint of flagellum abruptly narrower than the following; clypeus at apex subproduced.	
	Lioterphus Thomson (type Torymus pallidicornis Boheman	i).
5.	Thorax not especially long, the pronotum not conically elongate	6
	Thorax long, the pronotum much developed, conically elongate.	
	Abdomen with a distinct petiole, the body much compressed, shorter than the thorax, the	ìе
	ovipositor very long Ecdamua Walker (type E. macrotelus Walker	`).
6.	Mandibles 3-dentate; head not triangular; costal cell wide	7
	Mandibles 2-dentate; head subtriangular, as viewed from in front; costal cell narrow.	
	Callimomus Thomson (type C. scaposus Thomson).

7.	Prothorax not especially short; metathorax declivous, not largely punctate.
	Torymus Dalman (type Ichneumon bedeguaris Linné). Prothorax short, the metathorax abruptly declining, largely punctate; antennæ subclavate, the club
	lanceolate
8.	Antennæ 13-jointed, with only one ring-joint
	Antennæ 13-jointed, with two ring-joints
9.	Scutellum without a cross-furrow before apex
10	Mandibles 3-dentate; costal cell wide
10.	Mandibles 2-dentate; costal cell narrow
11.	Clypeus anteriorly normal, not produced
	Clypeus anteriorly subproduced mediallyLioterphus Thomson.
I 2.	Thorax normal, the pronotum not especially long
10	Thorax long, the pronotum elongate, conical
15.	Pronotum not especially short, the metathorax not largely punctate
	Subfamily III. Monodontomerinæ.
18	75. Torymides, Subtribus (partim) Thomson, Skand. Hym., IV., p. 59.
18	99. Monodontomerinæ, Subfamily III., Ashm. Proc. Ent. Soc. Wash., IV., p. 247.
	In this group the hind femora are more swollen than in the previous groups,
wł	nile the lower edge is serrate or armed with one or two teeth, thus showing an
ap	proach to the Podagrioninæ, and through that subfamily to the Leucospidinæ and
	e Chalcidinæ.
	Some of the species are parasitic upon hymenopterous and dipterous gall-mak-
ing	g insects; others, belonging to the genera <i>Physothorax</i> and <i>Plesiostigma</i> , have been
	ed from fig-insects, while species belonging to the genera Diamorus and Monodon-
	nerus are bred commonly from the nests of bees and wasps, and they are said to
	parasites of these insects. In a single case, at least, I have positive evidence that
	condontomerus was bred from the puparium of a tachinid-fly found in the nest
	th the bee.
	TABLE OF GENERA.
1.	Females; ovipositor prominently exserted
_	Males
2	Hind femora beneath very finely denticulate and usually also with a single large tooth, rarely with 2 teth
	Hind femora beneath smooth, with 1 or 2 large teeth, some distance from the apex
3.	Scutellum with a cross furrow before the apex
	Scutellum without a cross furrow before the apex.
	Abdomen short, not longer than the head and thorax united; stigmal vein very short.
	Holaspis Mayr (type Torymus militaris Boheman).
	Abdomen elongate much longer than the head and thorax united; stigmal vein not short, oblique
	The state of the s

4.	Abdomen with the hind margin of the first dorsal segment (or its flap) incised at the middle
	Monodontomerus Westwood (type M. obscurus Westw.).
5.	Funicle with 6 joints; head smooth or at most with sparse punctures
	Funicle with 7 joints; head and thorax with large, thimble-like punctures.
	Hind femora with a single tooth beneath towards apex
	(type Torymus armatus Boheman).
	Hind femora with two teeth beneath toward apex Physothorax Mayı
	(type Diamorus variabilis Mayr $ $
6.	Thorax delicately shagreened; hind femora with a single indistinct tooth beneath towards apex.
	Plesiostigma Mayr (type P. bicolor Mayr).
7.	Eyes bare; abdomen with the hind margin of the first dorsal segment incised; hind femora usually ser
	rate or with one or two teeth beneath towards apex
	Eyes hairy; abdomen with the hind margin of the first dorsal segment straight, not incised; hind
0	femora sometimes without a tooth
8.	Front femora much swollen, the pronotum longer than the mesonotum; antennæ with two ring-joints.
	Plesiostigmodes Ashmead, g. nov. (type P. brasiliensis Ashm.). Front femora normal, the pronotum shorter than the mesonotum; antennæ with one ring-joint.
	Hind femora serrate and usually with one tooth beneath; stigmal vein short but distinct, the
	knob always petiolate; thorax without thimble-like punctures Cryptopristus Förster
	(type Torymus caliginosus Walk.).
	Hind femora feebly serrate beneath without a tooth; stigmal knob sessile, the stigmal vein not
	developed; thorax with small, thimble-like punctures Hemitorymus Ashmead, g. nov.
	(type H. thoracicus Ashm.).
9.	Apterous or with rudimentary wings
	Winged.
	Hind femora beneath towards apex finely serrate and usually also with one or two teeth 13
	Hind femora beneath smooth with one large tooth some distance from the apex
10.	Scutellum without a cross-furrow before apex
	Scutellum with a cross-furrow before apex
11.	Stigmal vein very short; abdomen concave above
	Stigmal vein not short, oblique; abdomen not concave above
12.	Hind margin of the first dorsal segment incised at the middle
	Hind margin of the first dorsal segment straight, not incised at the middle.
	Monodontomerus Westwood.
13.	Head smooth, or at the most with sparse punctures; funicle 6-jointed
	Head and thorax with rather large, thimble-like punctures.
	Hind femora with a single large tooth; stigmal vein not short, the knob moderately large; hind
	tarsi very long, the first joint long
	Hind femora with two rather small teeth (normal form); stigmal vein very short, the knob very
	small; hind tarsi not especially long, the first joint not longer than 2 and 3 united. Physotherax Mayr.
14	Eyes bare; hind margin of first abdominal segment usually incised medially
LT.	Eyes hairy; hind margin of the first abdominal segment straight, not incised; hind femora usually
	without a tooth

15. Front femora much swollen, the hind femora finely serrate beneath; antennæ with 2 ring-joints.

Plesiostigmodes Ashmead, g. nov. (type P. brasiliensis Ashm.).

Front femora normal, the hind femora finely serrate beneath and often with a tooth; antennæ with 1 ring-joint.

Antennæ 2-jointed, the second clavate (dimorphic form)...Plesiostigma Mayr, Nannocerus Mayr. Antennæ 4- to 7-jointed; thorax not depressed; hind femora with 2 teeth beneath towards apex; hind tibiæ with spines only at base of tarsi (dimorphic form).......Physothorax Mayr.

SUBFAMILY IV. PODAGRIONINÆ.

This group in having the hind femora greatly swollen and dentate beneath, with the hind tibiæ curved, resembles the *Chalcididx*, but otherwise, in the structure of head, side pieces of the thorax, coxæ, and in venation, it is a genuine Torymid, and I have here removed it from the *Chalcididx*, where late authorities have placed it, to a place in this family.

The genus Podagrion is parasitic in the egg-cases of the orthopterous family Mantidx.

TABLE OF GENERA.

SUBFAMILY V. MEGASTIGMINÆ.

- 1875. Megastigmides, Subtribus, Thomson, Skand. Hym., IV., p. 59.
- 1899. Megastigmine, Subfamily IV., Ashmead, Proc. Ent. Soc. Washington, IV., p. 246.

The species falling in this subfamily are easily recognized by the large circular or rounded knob of the stigmal vein.

Species of the genus *Megastigmus* are bred commonly from hymenopterous and dipterous gall-makers (*Cynipidæ* and *Cecidomyiidæ*) and also from the seed capsules of various trees and plants. The group is, therefore, phytophagous as well as parasitic. *Megastigmus spermatotr_phus* Wachtl was bred from the seed of the Douglas spruce, *Pseudotsuga douglasii*. It is identical with *M. pinus* Parfitt, also bred from the seed of a pine and described thirty-six years earlier.

TABLE OF GENERA.

Abdomen distinctly petiolate, the petiole the length of the metathorax, the body short, elliptical, not compressed, shorter than the thorax; scutellum without a cross-furrow before tip.

Odopoia Walker (type O. atra Walker).

Abdomen subsessile, the body elongate, subcompressed, the length of the thorax; scutellum with a cross-furrow before apex......Bootania Dalla Torre (type Metamorpha leucospoides Walker).

SUBFAMILY VI. ORMYRINÆ.

- 1856. Ormyroidæ, Familie X., Förster, Hym. Stud., II., pp. 19, 22 and 24.
- 1875. Ormyrides, Subtribus, Thomson, Skand. Hym., IV., p. 100.
- 1899. Ormyrinæ, Subfamily V., Ashmead, Proc. Ent. Soc. Wash., IV., p. 247.

Dr. Arnold Förster was the first to separate this group from other Torymids. It is a very distinct and compact subfamily, agreeing with the subfamily *Toryminæ* in venation and in pleural and pedal characters, but otherwise it is totally different from it and the others. The females are easily recognized by the elongate, pointed, or conically produced abdomen, non-prominent ovipositor, and by its peculiar sculpture; the males by the oblong oval shape of the abdomen, as well as by the sculpture.

It shows some affinity with the *Eurytomide*, and particularly with my tribe *Rileyini*, in the shape of the pronotum, and in antennal and abdominal peculiarities.

All are bred from hymenopterous and dipterous gall-insects, belonging principally to the families *Cynipidæ* and *Cecidomyiidæ*; only a few species have been described.

Only three genera are known distinguished as follows:

TABLE OF GENERA.

1. Males; abdomen oblong, depressed
Females; abdomen long, conically pointed and more or less compressed, especially towards the apex,
the ovipositor never prominent
2. Abdomen without a peculiar sculpture, normal
Abdomen with a peculiar sculpture, and some of the segments with two rows of pits or deep punctures.
No large, coarse punctures at base of middle abdominal segments; antennæ with one ring-
joint
With large, coarse punctures at base of middle abdominal segments; antennæ with two ring-
joints
3. Abdomen finely punctate; antennæ with three ring-joints. Tribæus Förster (type T. punctulatus Först.).
4. Abdomen without a peculiar sculpture
Abdomen with a peculiar sculpture.
Antennæ with one ring-joint
Antennæ with two ring-jointsOrmyrus Westwood.
5. Anteunæ with three ring-joints

FAMILY LXII. CHALCIDIDÆ.

- 1830. Chalcidæ, Family (partim), Leach, Edinb. Encyc., IX., p. 144.
- 1840. Chalcidæ, Subfamily I. (partim), Westwood, Intro. Mod. Class. Ins., I., p. 166, Synop., p. 65.
- 1846. Chalcididæ, Family II. (partim), Walker, List Chalc. Brit. Mus., I., p. 2.
- 1856. Chalcidoidæ, Familie II., Förster, Hym. Stud., II., pp. 18, 21 and 29.
- 1875. Chalcidina Tribus, Thomson, Hym. Skand., IV., pp. 11, 12.
- 1886. Chalcidinæ, Subfamily (partim), Howard, Ent. Amer, I., p. 197.
- 1897. Chalcididæ, Family LXII., Ashmead, Proc. Ent. Soc. Washington, IV., p. 245.
- 1900. Chalcididæ, Family LXII., Ashmead, Proc. U. S. National Museum, XXIII., p. 202.

This family, although allied to the *Torymidx* and to the *Eurytomidx*, is very distinct in many particulars; by the usually very long, subcylindrical hind coxe, the greatly swollen hind femora, usually dentate or serrate beneath, by the strongly arcuate hind tibiæ which are usually obliquely truncately produced at apex, so that the tarsi appear to be attached a little before the tips, and by pronotal and abdominal differences.

The group is most extensively represented in South America, where many genera and many species have been discovered.

Two subfamilies have been recognized, distinguishable as follows:

TABLE OF SUBFAMILIES.

Front wings longitudinally folded; ovipositor curving upwards and backwards over the dorsum of the abdomen.

Subfamily I. Leucospidinæ.

Front wings not folded; ovipositor when prominent, straight, not curving over the dorsum of the abdomen.

Subfamily II. Chalcidinæ.

Subfamily I. Leucospidinæ.

- 1833. Leucopsidæ, Family, Walker, Ent. Mag., II., p. 13.
- 1839. Leucospidæ, Family XV., Haliday, Hym. Synop., p. ii.
- 1846. Leucospidæ, Family I., Walker, List Chalc. Brit. Museum, I., p. 1.
- 1856. Leucospoidæ, Family I., Förster, Hym. Stud., II., pp. 18, 20 and 29.
- 1886. Leucospinæ, Subfamily, Howard, Ent. Amer., I., p. 197.
- 1897. Leucospidinæ, Subfamily I., Ashmead, Proc. Ent. Soc. Wash., IV., p. 235.

Dr. von Dalla Torre, in his Catalogus Hymenopterorum, Vol. V., has incorrectly credited this subfamily to Förster; it should be credited to Walker, who designated it as a family as early as 1833.

The group is a natural one, and is very distinct from the other groups of the *Chal-cididæ*, in habits, in abdominal peculiarities—the ovipositor being curved forward

over the dorsum of the abdomen, often reaching to the scutellum, and in having the wings longitudinally folded as in the *Vespidæ*, *Eumenidæ* and in the Diapriid genus *Galesus*.

The group is parasitic in the nest of bees and the longitudinal fold in the wings is significant, for the leucospid is thus enabled to crawl into the nest of a bee without seriously disturbing its contents.

The group was monographed by Dr. August Schletterer in 1890, in the Berliner Entomologische Zeitschrift, vol. 35. This work should be in the hands of all stuents who desire to study these insects.

TABLE OF GENERA.

than the following; pronotum narrowed anteriorly; scutellum cordate.

Marres Walker (type M. dicomas Walker).

- 2. Abdomen more or less compressed, rounded or vertically angular posteriorly, but never pointed; ovipositor extends from beneath the venter and curves over the tip of the abdomen backwards, reposing upon the dorsum, sometimes extending to the scutellum; hind coxæ without a tooth above; maxillary palpi distinct, 4-jointed.
 - Abdomen more fusiform and not distinctly compressed, the paunch followed to the dorsum, with a long channel and with the apex pointed; ovipositor confined to the under surface of the abdomen and not extending further than to its tip; hind coxe with a strong erect tooth above; maxillary palpi 3-jointed, short and slender..........Polistomorpha Westwood (type P. surinamensis Walker).
- 3. Front coxe not especially long, much shorter than their femora, the tibiæ as long as the femora; middle tibiæ without a tooth at apex; hind tibiæ at apex normal, with 2 spurs.

Leucospis Fabricius (type L. dorsigera Fabricius).

Front coxæ very elongate, nearly as long as their femora, the tibiæ shorter than the femora; middle tibiæ with a tooth at apex; hind tibiæ curved and acutely produced into a spine at apex.

Exoclænus Shipp (type Leucospis anthidioides Westw.).

SUBFAMILY II. CHALCIDINÆ.

- 1835. Chalcidide, Family, Walker, Ent. Mag., II., p. 20.
- 1839. Chalcididæ, Family XVI., Haliday, Hym. Synop., p. ii.
- 1856. Chalcidoidæ, Familie, Förster, Hym. Stud., ii., p. 29.
- 1897. Chalcidinæ, Subfamily II., Ashmead, Proc. Ent. Soc. Wash., IV., p. 247.

In having the hind femora greatly swollen and usually dentate or serrate, this subfamily agrees with the *Leucospidinx*, but differs in having the front wings not folded longitudinally in repose, by having a much smaller pronotum, and quite a different shaped abdomen, the ovipositor, when prominent, being straight and never curved forward over the dorsum.

I have divided it into four tribes, which may be distinguished by the characters made use of in the following table:

TABLE OF TRIBES.
1. Abdomen sessile
Abdomen petiolate
2. Postmarginal vein wanting or only slightly developed, the stigmal vein very short, sometimes absent;
antennæ inserted close to the mouth border
Postmarginal vein always well developed, the stigmal vein rarely very short.
Antennæ inserted near the middle of the face, or at least always above an imaginary line
drawn from the base of the eyes
Antennæ inserted near the mouth border, or always below an imaginary line drawn from the
base of the eyes
3. Antennæ inserted near the mouth border, or always below an imaginary line drawn from the base of
the eyes
Antennæ inserted near the middle of the face, or always above an imaginary line drawn from the
base of the eyes
4. Postmarginal vein very long; ovipositor if prominent not very slender, the eighth dorsal segment often
produced into a long compressed stylus
5. Head normal, not cornuted.
Abdomen petiolateTribe III, Chalcitellini.
Abdomen sessile
Head abnormal, deeply excavated in front, cornuted; abdomen petiolate or subpetiolate.

Tribe V. Dirhinini

Tribe I. Chalcidini.

This group is distinguished by the sessile abdomen and by having the antennæ inserted near the middle of the face or at least never *below* an imaginary line drawn from the base of the eyes.

Through the genus Acanthochalcis it is related to the subfamily Leucospidinæ, while in the abdominal peculiarities of most of the species the group is much closer allied to the tribe Haltichellini.

Most of the genera attack principally lepidopterous insects in the pupal stage. *Phasgonophora*, however, and probably also the allied genera *Trigonura*, *Stypiura*, etc., prey upon wood-boring coleopterous larvæ.

TABLE OF GENERA.

1.	Females 2
	Males
2.	Scntellum normal, unarmed, although sometimes with a slight median depression towards apex; if
	with a slight elevated plate behind, the same is entire, rarely subemarginate
	Scutellum posteriorly armed, emarginate or produced
3.	Abdomen not ending in a long, distinct ovipositor, although the eighth dorsal segment is often much
	produced, long and compressed, resembling a stylus and enclosing the ovipositor 4

	Abdomen ending in a long, distinct ovipositor, which is sometimes as long as the whole body. Acanthochalcis Cameron (type A. nigrescens Cameron).
4.	Abdomen much produced at apex, the eighth dorsal segment long, compressed, resembling a stylus 5 Abdomen normal, subglobose or ovate, the eighth dorsal segment never very long
5.	Scutellum normal, rounded behind, if with a slight plate behind the same is entire, not emarginate 6 Scutellum terminating in a projection or plate posteriorly which is usually emarginate
6.	Abdomen at base rounded, not truncate
	Abdomen at base truncate, the truncature bounded by a carina. Antennæ 13-jointed, the flagellum long, slender, filiform
7	Eighth dorsal abdominal segment produced into a triangular stylus, the second segment (or the first
1.	body segment) occupying only about one third the length of the body; antennæ 11-jointed, sub-clavate
	Eighth dorsal abdominal segment very long, compressed but not triangular, the second segment variable, usually, however, occupying about half the length of the body; antennæ 11-jointed, filiform, tapering toward tips
8.	Scutellum with a short, thick projection behind
	Scutellum ending in a raised emarginate or bidentate plate. Metathorax unarmed
	Metathorax with two very prominent projections on each side, and very hairy.
	Abdomen with the eighth dorsal segment produced into a long stylus; antennæ 12-jointed. Megalocolus Kirby (type Halticella ducator Walker).
9.	Metathorax with two teeth on each side; hind femora armed with 7 or 8 teeth beneath. Pseuedocholcis Kirby (type Halticella declarator Walk.).
	Metathorax produced and excised medially; hind femora unarmed Oxycoryphe Kriechbaumer. (type O. subænea Kriechb.).
10.	Marginal vein very short, the postmarginal and the stigmal veins abnormally long; hind femora with numerous small teeth beneath (about 14); abdomen long, conically produced.
	Hind femora armed with one long tooth followed by 6 or 7 smaller teeth; antennæ 11-jointed. Stypiura Kirby (type Chalcis conigastra Perty).
	Hind femora with numerous depressed punctures, and with about 6 large teeth beneath; antennæ 13-jointed
11.	Antennæ 13-jointed, with 1 ring-jointed, rather short; hind femora armed with many minute teeth beneath
12.	Scutellum posteriorly unarmed, normal
12	Abdomen at base rounded, not truncate
υ.	Abdomen at base truncate, the truncature bounded by a carina Phasgonophora Westwood.
14.	Hind angles of metathorax rounded, not prominent
	Hind angles of metathorax prominent, acute, clothed above with usually a silvery white pubescence;
	thorax coarsely punctate, the abdomen punctate or at least not entirely impunctate; antennæ 11-jointed, the flagellum filiform

	Antennæ 13-jointed, with one ring-joint
	Antennæ 11-jointed, with one ring-joint.
	Marginal vein about four times the length of the stigmal vein; hind femora with 6 moderately
	large teeth beneath; antennæ 11-jointed, the flagellum filiform, the first joint shorter than
	the scape
	Marginal vein long, four or more times longer than the stigmal vein; hind femora with 8 teeth
	beneath; antennæ 11-jointed, the flagellum long, filiform, the first joint longer than the scape.
	Thaumatelia Kirby.
16.	Scutellum with a short thick projection behind; metathorax emarginate or armed
	Scutellum ending in a raised emarginate or bidentate plate; metathorax unarmed
17.	Metathorax produced and excised medially; hind femora unarmed Oxycoryphe Kriechbaumer.
	Metathorax usually with two teeth on each side (rarely normal); hind femora armed with 7 or 8
	teeth beneath
18.	Antennæ 11-jointed; marginal vein long, the stigmal vein normal, not very long.
	Hind femora armed with one large tooth, followed by 6 or 7 smaller teeth Stypiura Kirby.
	Hind femora with numerous depressed punctures and with 6 large teeth Epitelia Kirby.
	Antennæ (?) 12- or 13-jointed; marginal vein very short, the stigmal vein abnormally long; hind
	femora with numerous small teeth beneath (about 14)Larradomorpha Stadelman.
19.	Hind femora armed with many small teeth beneath
	Tribe II. Smicrini.
	This tribe approaches nearest to the tribe Chalcidini, but is at once separated
C	**
	om it by having the abdomen always distinctly petiolate, never sessile, and by
	ving the hind coxe abnormally long, as compared with those in the Chalcidini.
ha	ving the hind coxe abnormally long, as compared with those in the <i>Chalcidini</i> . The species are principally parasitic upon lepidopterous larvæ, although some ll attack other insects.

7.	Metathorax without lateral teeth or projections
	Metathorax with lateral teeth or projections
8.	Abdomen produced, the eighth segment in female greatly lengthened into a long compressed stylus;
	antennæ 13-jointed
	Abdomen conic-ovate or fusiform, the eighth segment in female normal or nearly, not produced into a stylus; antennæ 13-jointed.
	Petiole of abdomen very long and slender, as long as the thorax or nearly, or at least twice as
	long as the metathorax
	Petiole of abdomen usually short and stout, never very long or slender; scape of antennæ nor-
	mal, not extending beyond the ocelli Spilochalcis Thomson (type Chalcis xanthostigma Dalm.).
9.	Scape of antennæ abnormal, very long and usually clavate, extending far above the ocelli, its apex
	beneath sometimes excavated and enclosing the base of the flagellum; abdominal petiole slender
	and of a uniform thickness throughout Ceratosmicra Ashm., gen. nov. (type C. petiolata Ashm.).
	Scape of antennæ slender, cylindrical, not or scarcely reaching beyond the ocelli; abdominal petiole
	thickest at the middle, tapering off towards each end
10	(type Smicra debilis Say.).
10.	Scutellum normal, unarmed
	Metathorax quadridentate (two teeth on each side of the petiole); body of abdomen short ovate,
	the petiole shorter than the thorax; antennæ 13-jointed, the flagellum filiform, clothed with
	a dense, short pubescence, the scape short, subcompressed. Xanthomelanus Ashmead, gen. nov.
	(type Chalcis dimidiata Fabr.).
11.	Metathorax bidentate (one tooth on each side of the petiole); thorax never wholly black; antennæ
	13-jointed
	Metathorax quadridentate (two teeth on each side of the petiole); thorax sometimes wholly black;
	scape of antennæ long, extending beyond the ocelli.
	Thorax wholly black; body of abdomen ovate, the petiole variable in length, usually long and slender, but shorter than the thorax; antennæ 13-jointed, the flagellum filiform, the scape at
	tip beneath not excavated Melanosmicra Ashmead, gen. nov. (type <i>M. immaculata</i> Ashm.).
	Thorax yellow or yellow marked with black; body of abdomen usually conical, the petiole
	long; antennæ 13-jointed, the scape at apex beneath excavated.
	Ceratosmicra Ashmead (partim).
12.	$Scape\ of\ antennee\ normal\ ;\ body\ of\ abdomen\ in\ female\ fusiformly\ pointed\ or\ conic-ovate, the\ petiole\ very$
	short, not or rarely longer than thick
	Scape of antennæ usually long and extending much beyond the ocelli; body of abdomen ovate, the
	petiole very long and slender, as long or nearly as the thorax Mischosmicra Ashmead, gen. nov.
12	(type M. Kahlii Ashm.). Metathorax normal or with one small tooth on each side of the petiole; abdomen variable, subglobose,
10.	conic-ovate or fusiform, but rarely ending in a stylus; antennæ 13-jointed.
	Spilochalcis Thomson (partim).
14.	Antennæ 13- or 14-jointed
	Antennæ 12-jointed.
	Metathorax posteriorly quadridentate
15.	Antennæ 13-jointed
	Antennæ 14-jointed; hind coxæ usually with a leaf-like expansion at apex, their femora armed with
	large or moderate sized teeth Epinæus Kirby (type Smicra dux Walker).

16.	Hind femora armed with 8 large teeth or less
	Hind femora armed with 9 moderately large teeth.
	Scutellum sometimes unarmed but usually ending in a bidentate plate.
	Enneasmicra Ashmead, gen. nov. (type Smicra exinamius Walk.).
17.	Hind femora armed with 7 large teeth or less
	Hind femora armed with 8 large or moderate sized teeth (the 8th tooth sometimes reduced in size or
	followed by one or two minute teeth, or the 6th tooth is tridentate at apex).
	Mesonotum with distinct parapsidal furrows, or at least distinct anteriorly
	Mesonotum without distinct parapsidal furrows.
	Abdomen fusiformly pointed, the petiole very short; hind femora about 2½ times as long
	as wide
18.	Scutellum at apex usually ending in an emarginate or bidentate plate; abdomen in female lanceolate
	or conically produced; the 8th segment often long, styliform.
	Octosmicra Ashmead, gen. nov. (type O. laliceps Ashm.).
19	Hind femora armed with 6 large teeth or less.
10.	Hind femora armed with 7 large teeth, the seventh usually much reduced in size.
	Abdomen in female conically produced or fusiform, the 8th segment sometimes styliform or pro-
	duced into a stylus, the petiole not short; mandibles in φ bi- in δ tri-dentate.
	Heptasmicra Ashmead, gen. nov. (type Smicra obliterata Walk.).
90	
20.	Hind femore armed with 5 large teeth or less
	Hind femora armed with 6 large teeth (the 6th tooth sometimes broad and at apex 3-dentate).
	Metathorax armed with two triangular teeth and a lamina or plate just behind the insertion of
	the hind wings, the latter extending slightly over the metapleura, the sculpture coarse; teeth
	of hind femora short and stout Diplodontia Ashmead (type Smicra carolina Ashm.).
	Metathorax usually, but not always, armed with two, not very prominent, teeth, but without the
	lamina or plate behind the insertion of the hind wings, the sculpture alveolate; teeth of hind
	femora large, long.
	Abdomen in female subglobose or short ovate, the petiole always more than twice longer
	than thick
	Abdomen in female lanceolate or fusiformly produced, longer than the head and thorax
	united, the petiole very short, not longer than thick.
	Hexasmicra Ashmead, gen. nov. (type Smicra transversa Walk.).
21.	Hind femora armed with 4 large teeth or less
	Hind femora armed with 5 large teeth.
	Eyes very large, occupying nearly the whole sides of the head; mandibles broad, 3-dentate;
	scutellum usually ending in an emarginate or bidentate plate; metathorax alveolate.
	Pentasmicra Ashmead, gen. nov. (type P. brasiliensis Ashm.).
22.	Hind femora with 4 large teeth; metathorax usually with teeth or projections, rarely unarmed; plate
	at apex of scutellum bidentate or broadly emarginate; abdomen ovate or conic-ovate, rarely
	fusiform, the eighth segment in female never very longTetrasmicra Ashmead, gen. nov
	(type Smicra concitata Walk.).
	Hind femora with 3 large teeth
23.	Middle tibiæ without an apical spur
	Middle tibiæ with an apical spur

24. Antennæ 12- or 13-jointed; thorax black; hind femora armed with many minute teeth. Smicra Spinola.
Antennæ 14-jointed; thorax yellow or yellow marked with black; hind femora armed with 6 teeth.
Epitranus Walker.
25. Hind femora armed with one large tooth near base followed by many small or minute teeth, from 10
to 20 or more.
· · · · · · · · · · · · · · · · · · ·
Hind femora armed with from 3 to 9 large teeth
26. Metathorax armed with from 2 to 4 teeth or projections
Metathorax unarmed.
Scutellum at apex unarmed, without an emarginate or bidentate plate
Scutellum at apex armed with an emarginate or bidentate plate.
27. Abdominal petiole very long and slender, as long as the thorax or nearly
Abdominal petiole usually short and stout, or at least never very long nor very slender.
Pronotum anteriorly rounded or sloping, not acute; petiole carinate. Eustypiura Ashmead.
Pronotum anteriorly acute; petiole not carinateSpilochalcis Thomson.
28. Scape of antennæ abnormal, long and clavate, extending far above the ocelli. Ceratosmicra Ashmead.
Scape of antennæ slender, cylindrical, not or only slight extending above the ocelli. Sayiella Ashmead.
29. Metathorax bi-dentate; a tooth on each side of the petiole.
Scape of antennæ normal; abdominal petiole not very long nor slender.
Spilochalcis Thoms. (partim).
Scape of antennæ usually long and slender, extending much beyond the ocelli; abdominal
petiole very long and slender, as long or nearly as long as the thorax.
Mischosmicra Ashmead.
Metathorax quadridentate; two teeth on each side of the petiole.
Scutellum at apex, bidentate or with an emarginate plate Xanthomelanus Ashmead.
Scutellum at apex normal, unarmed.
Thorax wholly black; scape of antennæ normal, petiole of abdomen normal.
Melanosmicra Ashmead.
Thorax yellow or yellow marked with black; scape of antennæ abnormal; petiole of ab-
domen very long.
Scape long and clavate, excavate at apex beneath, extending far above the ocelli.
Ceratosmicra Ashmead.
Scape slender, cylindrical and extending only slightly beyond the ocelli.
Sayiella Ashmead.
30. Antennæ 13- or 14-jointed.
Antenuæ 12-jointed; metathorax quadridentat
31. Antennæ 13-jointed
Antennæ 14-jointed.
Hind femora armed with large or moderate-sized teeth Epinæus Kirby.
32. Hind femora armed with 8 large teeth or less
Hind femora armed with 9 moderately large teeth
33. Hind femora armed with 7 large teeth or less
Hind femora armed with 8 large teeth.
Mesonotum without distinct parapsidal furrow
Mesonotum with distinct parapsidal furrowsOctosmicra Ashmead.
34. Hind femora with 6 large teeth or less
Hind femora with 7 large teeth

35. Hind femora armed with 5 large teeth or less
Hind femora armed with 6 large teeth.
Metathorax armed with two triangular teeth or projections and a lamina or plate just behind the
insertion of the hind wings that extends slightly over the mesopleura; teeth of hind femora
short and stout
Metathorax sometimes armed with two teeth, sometimes unarmed but always without the
lamina or plate.
? of unknown
? of unknown Hexasmicra Ashmead.
36. Hind femora armed with 4 large teeth or less
Hind femora armed with 5 large teeth
37. Hind femora armed with 4 large teeth. Tetrasmicra Ashmead.
Hind femora armed with 3 large teeth
Tribe III. Chalcitellini.
1RIBE 111. Chaicheann.
This tribe is proposed for a small group closely allied to the tribe <i>Haltichellini</i> ,
but is easily distinguished by the distinctly petiolate abdomen.
The group is unknown to the American fauna, although some South American
• • • • • • • • • • • • • • • • • • • •
genera in the Smicrini come quite close to it; they are, however, easily separated
by having the antennæ inserted farther up on the face and not low down close to
the mouth, as in this tribe.
TABLE OF GENERA.
1. Females
Males. 4
2. Antennæ 13-jointed
Antennæ 11-jointed (the club indistinctly jointed).
Hind femora with 7 or 8 large teeth
3. Hind tibiæ without a tooth outwardly near base, the hind femora armed with many very minute teeth.
Arretocera Kirby (type Epitranus albipennis Walk.).
Hind tibiæ with a tooth outwardly near base, the hind femora with one large tooth and then finely
serrate beyond
4. Characters as in females.
Tribe IV. Haltichellini.
This tribe resembles most closely the tribe Chalcidini and is separated from it
with dicuffilty, the difference in the insertion of the antennæ alone being the only
·
character that readily distinguishes the two tribes.
In this tribe the antennæ are inserted <i>close</i> to the mouth border, the scape being
long, while the postmarginal vein is wanting, or rarely very long as in the Chalcidini
and the Smicrini.
TABLE OF GENERA.
1. Females 2
Males

2.	Hind femora with one or more large teeth or projections beneath, as well as being finely denticulate
0	or serrate
3.	Metathorax normal, without projections
,	Metathorax with projections, i. e., spines or teeth on each side posteriorly
4.	Hind femora with two prominences or elevations beneath and minutely denticulate.
	Hockeria Walker (type H. dexius Walk.).
	Hind femora not so formed, at the most with one prominence or one tooth, the edges beyond usually
<u>_</u>	finely denticulate or serrate. 5
Э.	Antennæ 13-jointed; scape without a tooth beneath near the middle
	(type Euchaleis vetuta Dufour).
	Antennæ 11-jointed; scape with a tooth beneath near the middle
e	(type E. miegii Dufour).
0.	Scutellum at apex bidentate; hind femora armed with 11 small teeth beneath; antennæ 11-jointed.
-	Allocera Sichel (type A. bicolor Sichel).
1.	Metathorax normal, without projections or teeth
0	Metathorax with projections or teeth on each side
ъ.	Scutellum normal, neither bidentate nor spined. 9
0	Scutellum either spined or bidentate at apex
у.	Hind femora beneath with the edges finely denticulate or serrate, the head normal or not very thin antero-posteriorly
	Hind femora swollen but the edges beneath simple, not denticulate, the head lenticular and very thin
	antero-posteriorly, wider than the thorax, the ocelli on a straight line; stigmal vein curved, not
	short, a little longer than half the length of the marginal vein; costal cell broad; antennæ 13-
	jointed, with 2 ring-joints Encyrtocephalus Ashmead (type E. simplicipes Ashm.).
10.	Antennæ 13-jointed; abdomen short, the second segment (first body segment) occupying about half the
	whole surface; hind femora armed with about 12 small teeth
	type Chalcis pusilla Spinola).
	Antennæ 12-jointed; abdomen short, the second segment occupying fully half the whole surface; hind
	femora very minutely denticulate beneath
11.	Scutellum at apex bidentate
	Scutellum at apex produced into a long, stout spine
12.	Antennæ 12-jointed, very long, the scape long; hind femora unarmed Antrocephalus Kirby
	(type Haltichella fascicornis Walk.).
	Antennæ 11-jointed, the flagellum very long and slender; hind femora beneath with the apical half or
	so finely denticulate and often hairyStomatoceras Kirby (type Halticella liberator Walk.).
13.	Antennæ 11-jointed, the flagellum subclavate, deusely pilose; hind femora unarmed.
	Aspirhina Kirby (type Halticella dubitator Walk.).
	Antennæ 12-jointed, the flagellum filiform; hind femora armed with one large triangular tooth, the
	edges beyond finely serrateNotaspidium Dalla Torre (type Notaspis formiciformis Walk.).
14.	Antennæ 10- or 11-jointed
	Antennæ 12-jointed.
	Wings not variegated
	Wings variegated.
	Metathorax with a stout spine on each side; abdomen with the second segment occupying
	half the whole surface Trichoxenia Kirby (type Halticella cineraria Walk.).

15.	Metathorax long with a long projection on each side posteriorly; abdomen not longer than the thorax, subcompressed at the sides, the second segment long; subcostal vein ending in a knob, the marginal, postmarginal and stigmal veins not developedHybothorax Ratzeburg (type H. graffii Ratzeb.). Metathorax short, ending in two long divergent spines; abdomen oval, acute at apex, the second segment long; marginal vein present; the stigmal vein short, not distinct.
	Kriechbaumerella Dalla Torre (type Calops palpebrator Kriecht).
16.	Antennæ 10-jointed.
	Postmarginal vein long and slender, the stigmal vein short, its knob subpetiolate; head viewed from in front triangular; abdomen briefly pointed at apex.
	Hippota Walker (type Chalcis pectinicornis Latr.).
17.	Hind femora with one or more large teeth or projections beneath, as well as being finely denticulate or serrate
	Hind femora without a large tooth or projection beneath, simple or smooth, or at the most finely den-
	ticulate beneath
18.	Metathorax normal, without projections or teeth
	Metathorax with projections or teeth on each side
19	Hind femora with a single large triangular tooth; scutellum produced into an acute spine.
10.	Antennæ 12-jointed
	Hind femora with one or two prominent projections beneath near the middle and finely denticulate or
	serrate.
	Hind femora with one prominence
	Hind femora with two prominences
20.	Antennæ 13-jointed
	Antennæ 12-jointed Euchalcis Dufour-
21.	Metathorax normal, without projections
	Metathorax with a projection on each side
22.	Scutellum normal, neither bidentate nor spined
	Scutellum either spined or bidentate
99	
20.	Hind femora beneath with the edges finely denticulate or serrate; head normal, or at least not very
	thin antero-posteriorly
	Hind femora beneath smooth, not denticulate.
	Head lenticular, very thin antero-posteriorly and wider than the thorax; antennæ normal, 13-
	jointed, with 2 ring-joints; middle tibiæ slender Encyrtocephalus Ashmead.
	Head normal; antennæ abnormal, 13-jointed, with 1 ring-joint, the pedicel and first two joints of
	the flagellum each covered above by a broad lamina or horny flap; middle tibiæ clavate.
	Schwarzella Ashmead, g. nov. (type S. arizonensis Ashm.).
24.	Antennæ 13-jointed
	Antennæ 12-jointed
25	Antennæ 11- or 12-jointed
20.	Antennæ 13-jointed.
9.0	
20.	Scutellum produced into a long, stout spine
	Scutellum at apex bidentate or with a median impression.
	Antennæ 12-jointed
	Antennæ 11- jointed
27.	Antennæ 11-jointed; hind femora unarmed
	Antennæ 12-jointed; hind femora with a large, triangular tooth Notaspidium Dalla Torre.

ASHMEAD: CLASSIFICATION OF THE CHALCID FLIES 251
28. Antennæ 10- or 11-jointed
Antennæ 12-jointed.
Wings not variegated
Wings variegated
29. Metathorax long, with a long projection on each side posteriorly; subcostal vein ending in a knob, the
marginal and stigmal veins not developed
Metathorax short, ending in two long divergent spines; marginal and stigmal veins present.
Kriechbaumerella Dalla Torre.
30. Antennæ 10-jointed (or 11-jointed with a ring-joint)
Tribe V. Dirhinini.
This tribe is distinguished from all the others by having the head deeply emar-
ginate and horned. The antennæ are inserted close to the mouth as in the
Haltichellini.
TABLE OF GENERA.
1. Female
Males 4
2. Ovipositor not exserted; head with two horns
Ovipositor strongly exserted, long; head with four horns; antennæ 13-jointed.
Hontalia Cameron (type H. cærulea Cameron). 3. Metathorax strongly bidentate.
Antennæ 12-jointed
Antennæ 13-jointed Eniaca Kirby (type Chrysis hesperidum Rossi).
4. Head with <i>two</i> horns
Head with four horns.
Metathorax without teeth; antennæ13-jointed
5. Metathorax strongly bidentate.
Antennæ 12-jointed
Antennæ 13-jointed
FAMILY LXIII. EURYTOMIDÆ.
1830. Cynipsida Leach, Edinb. Encyc., IX., p. 144.
1833. Eurytomidæ, Family I., Walker, Ent. Mag., I., p. 12.
1840. Eurytomides, Subfamily 2, Westwood, Intro. Mod. Class. Ins., II., p. 166;
Synop., p. 66.
1846. Eurytomidæ, Family 3, Walker, List Chalc. Brit. Museum, i., p. 8.
1856. Eurytomoidæ, Familie XII., Förster, Hym. Stud., ii., pp. 19, 23, 44.
1875. Eurytomina, Tribus, Thomson, Hym. Skand., IV., pp. 11, 25.
1886. Eurytominæ, Subfamily, Howard, Ent. Amer., I., p. 19.
1897. Eurytomidæ, Family LXIII, Ashmead, Proc. Ent. Soc. Wash., IV, p. 245.
On account of the diversity of habits among the various groups composing this
family it is one of the most interesting of all of the families in this great complex
to study, except possibly the family Agaonidæ.
is stary, except possibly the fainity riguotitude.

Some are phytophagous or gall-makers; others live in the nests of bees and wasps; others are parasitic upon gall-making Hymenoptera and Diptera; while still others are genuine parasites on Coleoptera and other insects, and a few, representing my tribe *Rileyini*, destroy the eggs of orthopterous insects.

The family may be separated into five tribes as follows:

TABLE OF TRIBES

	TABLE OF	F TRIBES.	
		n the scutellum, usually dis	- 11 / 111

Mr. Peter Cameron, in Biol. Centr. Amer. Hym., Vol. 1, p. 111, established for Axima Walker and Hontalia Cameron, the subfamily Aximinæ. The two genera, however, have nothing in common, are quite distinct in structural characters and belong to different families. Mr. Cameron was evidently deceived in regard to their relationship by a superficial resemblance in the structure of the heads of these insects. Axima is clearly a eurytomid, as I first pointed out several years ago, while Hontalia is a chalcidid allied to Dirhinus, and must be placed in my tribe Dirhinini. Axima is parasitic in the nests of the small carpenter bees, Ceratinidæ.

TABLE OF GENERA.

1.	Females	2
	Males	3
9	Marginal voin form on more times langer than the stigmal voin, entenum 11 jointed the funished	

259 ASHMEAD: CLASSIFICATION OF THE CHALCID FLIES Marginal vein hardly twice the length of the stigmal vein; antennæ 11-jointed; abdomen not long, 3. Marginal vein four or more times longer than the stigmal; antennæ 11-jointed, the funicle joints long, Tribe II. Isosomini. All the species falling in this tribe are phytophagous and thus differ in habits from all of the other tribes.

The group approaches very close to the Eurytomini and many of the species were at first described under the genus Eurytoma. There is, however, a well marked structural difference between them, and the tribe may be easily separated by the characters made use of in my table of tribes. In having a long metathorax and in the antennal characters of most of the genera, the Isosomini approach nearest to the Aximini, but the horned head in the latter is sufficient to keep them apart.

1	TABLE OF GENERA.
1.	Females
	Males 8
2.	Apterous
	Winged.
	Marginal vein always longer than the stigmal vein
	Marginal vein shorter than the stigmal vein, the latter very oblique, extending off from the
	marginal at an angle of thirty degrees.
	Head and thorax umbilicately punctate, the frons with a deep antennal furrow; abdo-
	men elongate, conic-ovate, the dorsal segments subequal, as in Isosoma.
	Isosomodes Ashmead (type Isosoma gigantea Ashm.).
3.	Metathorax sloping or rounded behind, not abruptly and squarely truncate behind
	Metathorax quadrate, abruptly and squarely truncate behind.
	Mesonotum delicately umbilicately punctate; abdomen ovate, slenderer than the thorax, the
	second segment the longest, the others about of an equal length.
	Isosomorpha Ashmead (type I. europæ Ashm.).
4.	Thorax more or less distinctly umbilicately punctate, punctate or shagreened, opaque, never smooth
	and shining; antennæ usually 11-jointed, with 1 ring-joint, the funicle 5-jointed 5
	Thorax smooth and shining, impunctate or at the most feebly microscopically shagreened 6
5.	Mesonotum umbilicately punctate, punctate or rugulose; abdomen usually long, conically pointed,
	the segments subequal in length, the fourth not or only slightly longer than the third.
	Isosoma Walker (type Ichneumon verticellata Fabr.).
	Mesonotum with the middle lobe nearly smooth, delicately punctate, with usually delicate transverse
	aciculations anteriorly; abdomen very long, conically pointed, the fourth segment very long.
	Euoxysoma Ashmead (type Systole brachyptera Ashm.).

6. Pedicel longer than the first joint of the funicle, the joints of the latter moniliform or nearly; abdomen ovate, with the fourth segment much longer than the others, except the second; postmarginal vein

	Pedicel shorter than the first joint of the funicle or no longer, the first three joints of the funicle obconi-
	cal; abdomen conically pointed, with the segments, except the second, which is the longest, nearly
	of an equal length (sexual form)
7.	Mesonotum and scutellum highly polished, impunctate; abdomen conic-ovate, as long as the head and
	thorax united; antennæ 11-jointed, the funicle 5-jointed, the first joint the longest, obconical, longer
	than the pedicel (Agamic form)
8.	Marginal vein always longer than the stigmal vein
	Marginal vein shorter than the stigmal vein.
	Head and thorax umbilicately punctate, the former with a deep frontal furrow; flagellum fili-
	form, the joints of the funicle long, three or more times longer than thick, briefly pedicellate
	at apex, with two whorls of long hairs on each joint Isosomodes Ashmead.
9.	Metathorax not abruptly and squarely truncate behind, either sloping or rounded
	Metathorax quadrate, abruptly and squarely truncate behind; head and thorax umbilicately punctate.
	Isosomorpha Ashmead.
10.	Thorax smooth and shining, impunctate or at the most very feebly, microscopically shagreened 13
	Thorax more or less distinctly umbilicately punctate, finely punctate, or coarsely shagreened,
	opaque
11.	Head and thorax finely punctate
	Head and thorax more or less umbilicately punctate or coarsely shagreened.
	Mesonotum more or less distinctly umbilicately punctate, not finely transversely aciculate ante-
	riorly; funicle joints long, more than thrice longer than thick, constricted or briefly pedicellate
	at apex, with indistinct whorls of long hairs
	Mesonotum not so punctate, the middle lobe smoother, delicately punctate, with usually delicate
	transverse aciculations anteriorly
12.	Metathorax elongate; abdomen clavate, the petiole slender, punctate, as long as the hind coxe, the
	body a little longer than the thorax; antennæ filiform, slender, pubescent.
	Aiolomorphus Walker (type A. rhopaloides Walk.).
13.	Funicle joints long, subcontracted near the middle and subpetiolate at apex, each joint with two, some-
	what irregular, whorls of long hairs
	Funicle joints long, petiolate or subpetiolate at apex, with long hairs, but not arranged in two whorls
	and the joints cylindrical, without a median contraction; abdomen oblong-oval, the petiole rugulose,
	about twice as long as thick or a little longer, the second segment the longest segment, longer than
	the third and fourth united, the latter about equal with those beyond Philachyra Haliday.

TRIBE III. Eurytomini.

This is the most extensive tribe in the family and the National Museum collection contains many undescribed species. All of the species are genuine parasites and destroy the larvæ of several orders, Hymenoptera, Diptera, Coleoptera, etc.

Dr. A. D. Hopkins, of the West Virginia State Agriculture College, claims, however, that *Bruchophagus* (*Eurytoma*) funebris Howard is phytophagous and states he has proved it by a series of experiments. I think, however, some mistake has been made and I cannot accept Dr. Hopkins' observation as conclusive. Dr. Howard described it as having been bred from *Cecidomyia lugumicola* Lintner, living

in clover seed. All the other species, however, belonging to this genus, whose parasitism is known, destroy coleopterous larvæ, and I am inclined to think that both Drs. Howard and Hopkins are wrong, and that *Bruchophagus funebris* is a parasite upon some *Bruchus*, or the larva of a small rhynchophorous beetle living in the clover seed.

The genera are numerous, but it is believed these may be easily recognized by the use of the following table:

	TABLE OF GENERA.
1.	Females
	Males
2.	Non-metallic 3
	Metallic green or blue, coarsely, umbilicately punctate.
	Head in front quadricarinate (a carina along the inner orbits and bounding the frontal furrow);
	eyes surrounded by a ring of coarse punctures; antennæ 11-jointed, sometimes appearing
	only 9-jointed by the union of the club joints; funicle 5-jointed, the joints long, the first the
	longest, about two-thirds the length of the scape; abdomen conic-ovate, the fifth segment the
	longest
3.	Mesonotum distinctly umbilicately punctate
	Mesonotum not umbilicately punctate, smooth or nearly, shagreened, or at least rugulosely punctate. 12
4.	First joint of the funicle elongate, as long or nearly as the scape, or at least never less than two-thirds
	the length of the scape
	First joint of the funicle not especially long, never longer than half the length of the scape, but
	usually much shorter than that
5.	Head with a deep antennal channel, the front ocellus lying in it at apex; antennæ 11-jointed, filiform,
	not or only slightly thickened toward apex.
	Abdomen rarely much longer than the head and thorax united, strongly compressed, pointed at
	apex; seen from the side, the dorsum is strongly convexly elevated, the fifth segment the
	longest
	Abdomen very elongate, narrow, lanceolate, compressed, fully twice as long as the head and
	thorax united, the segments more nearly equal in length.
e	Aximogastra Ashmead, gen. nov. (type A. bahiæ Ashm.). Mesonotum with distinct, complete parapsidal furrows
0.	Mesonotum without parapsidal furrows or the furrows are only indicated anteriorly
-	Head sometimes with a deep frontal channel or antennal furrow, but the front ocellus is never placed
1.	within it, but always above it near the anterior margin of the vertex
	Head with a deep frontal channel or antennal furrow, the front occllus always placed at the apex of
	this furrow, never above it.
	Scape elongate, more than twice longer than the first joint of the funicle, the funicle joints
	rather long, the first about twice as long as thick; abdomen compressed, not longer than the
	head and thorax united, ending in a conical point; the dorsum, as seen from the side, is
	highly convexly elevated; postmarginal vein variable, sometimes shorter than the marginal,
	but rarely very much longer; hind tibiæ with rather short, stiff bristles behind.
	and the state of t

Prodecatoma Ashmead, gen. nov. (type P. flavescens Ashm.).

8.	Marginal vein always distinctly longer than the stigmal vein, the postmarginal vein well developed, sometimes very long
	Marginal vein short, not, or scarcely, longer than the stigmal vein, usually a little shorter, the post-mar-
	ginal vein rarely well developed, rarely as long as the stigmal (in only a single case is it very long) 13
9.	Hind tibiæ with 2 apical spurs
	Hind tibiæ with 1 apical spur.
	Funicle with the joints oval-moniliform; eyes broadly oval.
	Phylloxeroxenus Ashmead (type Eurytoma phyllexeræ Ashm.).
10.	Postmarginal vein very long, fully twice as long (or even longer) as the stigmal vein
	Marginal vein scarcely longer than the stigmal; antennæ clavate, the club large, 3-jointed, the
	joints of the funicle moniliform; abdomen with the fifth segment, as seen from the side, two or more times longer than wide; head convex in front, the occiput deeply concave.
	Eurytomocharis Ashmead (type E. minuta Ashm.).
	Marginal vein very distinctly longer than the stigmal; antennæ filiform or nearly, at most sub-
	clavate, not greatly thickened towards apex, the joints of the funicle oblong, cylindrical;
	abdomen conic-ovate, subcompressed, the fifth segment, as seen from the side, shorter than
	wide Eurytoma Illiger (type E. planata Illig.).
11.	Hind tibiæ normal, not dilated
	Hind tibiæ compressed, dilated.
	Head transverse, wider than the thorax, and thin antero-posteriorly, the eyes more or less
	rounded, prominent; antennæ inserted far above the middle of the face, the scape very long,
	reaching far above the ocelli and with a tooth or tubercle at apex beneath, the flagellum filiform
	with sparse hairs, the funicle joints more than twice longer than thick; abdomen very strongly
	compressed, the petiole long and slender. Eudoxinna Walker (type Sesxetra transversa Walk.).
12.	Marginal vein at least one and a half times as long as the stigmal vein, the postmarginal vein not longer than the stigmal; abdomen conic-ovate, longer than the thorax, the fifth segment nearly
	twice as long as the fourth; antennæ 11-jointed, the flagellum subclavate, the joints of the funicle
	submoniliform
	Marginal vein not or scarcely longer than the stigmal vein and stout; antennæ 11-jointed, the fla-
	gellum clavate or subclavate; abdomen globose, or short ovate, shorter than the thorax, the segments
	subequalSystole Walker (type S. albipennis Walk.).
13.	Abdomen short, subglobose, the fourth segment much the longest, enclosing the following.
	Systolodes Ashmead (type S. brevicornis Ashm.).
	Abdomen ovate, subcompressed (the tip sometimes produced into a stylus), the fourth and fifth segments short, although a little longer than the others, and subequalBruchophagus Ashmead
	(type B. borealis Ashm.).
14.	Head with a deep frontal furrow; abdomen ovate, subcompressed, petiolate, the petiole usually not short, the fifth segment the longest, but not greatly longer than the fourth.
	Funicle 5-jointed, the joints moniliform or submoniliform, the first much shorter than the
	pedicel
15.	Non-metallic, smooth, delicately shagreened or umbilicate punctate, rarely finely punctate 16 Metallic green or blue, coarsely umbilicately punctate.
	Head in front quadricarinate, the carina along the orbits sometimes delicate; funicle with the
	joints excised at apex above, with whorls of long hairs

16.	Mesonotum closely, distinctly, umbilicately punctate
	Mesonotum not umbilicately punctate, either smooth or nearly, or shagreened or finely, regularly sculp-
	tured
17.	First joint of the flagellum long, as long as the scape or longer
	First joint of the flagellum not especially long, always much shorter than the scape
18.	Head with a deep antennal furrow, the front ocellus placed within the furrow.
	? Known to me in \cite{Q} sex only
	? Known to me in \circlearrowleft sex only
19.	Mesonotum without or with incomplete furrows
	Mesonotum with distinct, complete furrows.
	Head sometimes with a deep antennal furrow, but the front ocellus is never situated in the fur-
	row
	Head with a deep antennal furrow, the front occllus always placed in the furrow at its apex.
	Prodecatoma Ashmead.
20.	Marginal vein always distinctly longer than the stigmal vein, the postmarginal vein well developed,
	sometimes very long, always longer than the stigmal
	Marginal vein short, not or scarcely longer than the stigmal vein, usually shorter, the postmarginal
	vein not well developed, not longer than the stigmal
21.	Hind tibiæ with 2 apical spurs
	Hind tibiæ with 1 apical spur
22.	Postmarginal vein only a little longer than the stigmal vein
	Postmarginal vein very long, fully twice as long (or longer) as the stigmal vein
23.	Marginal vein always distinctly longer than the stigmal vein
	Marginal vein only a little longer than the stigmal Eurytomocharis Ashmead.
24.	Funicle 5-jointed, the joints at apex excised above and pedicellate with long, whorled hairs; body of
	abdomen rather small, subovate, the petiole usually longer than the hind coxæ, the fourth segment,
	counting the petiole as the first, the longest
25.	Scape of antennæ long, with a tooth or tubercle at apex beneath; joints of funicle long, slightly con-
	tracted at the middle, each joint with two whorls of long bristles Eudoxinna Walk.
26.	Marginal vein slender, at least one and a half times as long as the stigmal vein, the postmarginal vein
	not longer than the stigmal
	Marginal vein rather stout, not longer than the stigmal vein; funicle 4-jointed, the joints oval, briefly
	petiolate at apex, with long, sparse hairs; abdomen small, oval, the petiole about twice as long as
	thick; dorsal segment 2-4 subequal
27.	Funicle 4-jointed, the joints excised at apex above, the basal or thickened portion about twice as long
	as thick, with long hairs above; abdomen small, globose, the petiole rugulose, the fourth segment the
	longest
	Funicle 4-jointed, the joints briefly pedunculate at apex, with sparse, long, irregular hairs; body of
	abdomen oval, the petiole short, stout, the fourth segment the largest Bruchophagus Ashmead.
28.	Head with a deep antennal furrow

Tribe IV. Rileyini.

In this tribe the antennæ are alike, or very similar, in both sexes and 13-jointed, with two or three ring-joints; they are never 12-jointed or less as in the other tribes.

I consider the species composing this tribe to be genuine Eurytomids, but with a habitus quite their own and difficult to describe intelligently—the head, pronotum and abdomen being slightly different from those in the Eurytomini. The sculpture, too, except in the genus Neorileya, is different from other Eurytomids. The shape of the abdomen in some of the species recalls to mind the subfamily Ormyrina, in the Torymida, the species of which have similar antenna and show same affinity with this tribe.

Macrorileya is parasitic in the eggs of tree-crickets (*Œcanthus* sp.); a species of *Neorileya* was bred by Mr. Urich, in Trinidad, W. I., from an egg of an unknown orthopterous insect; while the species belonging to the genus *Rileya* are parasitic upon the larvæ of various Cecidomyiids.

TABLE OF GENERA.

Pronotum as wide as the mesonotum, the hind margin arcuately emarginate, straight and truncate in front; mesonotum without furrows; axillæ rather small, triangular, widely separated; antennæ 13-jointed, with two ring-joints, the flagellum short, not twice the length of the scape, subfiliform, the funicle 6-jointed, the joints subquadrate, hardly as long as wide; marginal vein scarcely longer than the stigmal, shorter than the postmarginal; abdomen oval, depressed, shorter or not longer than the thorax, subconvex above, and briefly petiolate, the fourth segment much the longest, the third very short, the second and fifth about equal, united not longer than the fourth..... Neorileya Ashmead, g. nov. (type N. flavipes Ashm.).

3. Antennæ with three ring-joints.

Pronotum quadrate, a little narrower than the mesonotum and hardly shorter than wide; parapsidal furrows distinct, complete; head transverse, as wide as the thorax across from tegula to tegula, subconcave behind, convex in front, with a frontal excavation for the antennal scape; flagellum subclavate, the funicle 6-jointed, joints 2–6 subquadrate, the last two a little wider than long; marginal vein very long, more than twice longer than the stigmal vein, the postmarginal vein very long and slender; abdomen very long and narrow, lanceolate, subcompressed, nearly twice as long as the head and thorax united, joints 5, 6 and 7 long, the sixth the longest of the three, the eighth projecting and pointed.

Macrorileya Ashmead g. nov. (type Rileya acanthi Ashm.).

ASHMEAD: CLASSIFICATION OF THE CHALCID FLIES 265 Antennæ with two ring-joints. Head and thorax umbilicately punctate, the parapsidal furrows wanting; pronotum as wide as the mesonotum, the hind margin arcuately emarginate; flagellum filiform, pubescent, the 5. Head and thorax smooth or nearly, at most very finely punctate or microscopically shagreened, the parapsidal furrows sometimes delicate but distinct. Pronotum as wide as the mesonotum, more than twice wider than long; abdomen ovate, the fourth segment very long; flagellum filiform, pubescent, the joints of the funicle nearly Pronotum quadrate, nearly as long as wide and a little narrower than the mesonotum; abdomen elongate, cylindrical, as long as the head and thorax united, the segments subequal; flagellum subclayate, gradually thickened towards the tip, the last two joints of funicle transverse.

Macrorileya Ashmead.

Tribe V. Decatomini.

This tribe is very closely allied to the tribe Eurytomini, but is readily separated from it and the other tribes by the much thickened or stigmated marginal vein, and by the antennæ being alike, or very similar, in both sexes. The hind tibiæ are always armed with rigid bristles behind. Some of the Eurytomini, however, also have similarly armed tibite, so that this character in itself is not sufficient to distinguish the group.

All the species are parasitic upon hymenopterous and dipterous gall-makers. (Cynipidæ and Cecidomyiidæ).

Only two genera fall into this tribe, distinguished as follows:

TABLE OF GENERA.

1.	Females	
2.	Wings hyaline, with a dusky submarginal blotch or band; antennæ 9-jointed, with one ring-joint, t club usually not jointed, if with 3 indistinct joints, 11-jointed, pedicel obconical, nearly thrice as lo as thick at apex	ng
	Wings hyaline, without a dusky submarginal blotch; pedicel shorter, not or hardly twice as long thick at apex	
3.	Wings hyaline, with a dusky or fuscous submarginal blotch or bandDecatoma Spino Wings hyaline, without a dusky submarginal blotch; all femora considerably swollen.	la.

Eudecatoma Ashmead.

FAMILY LXIV. PERILAMPIDÆ.

- 1846. Eucharidæ, Family (partim), Walker, List Chalc. Brit. Museum, I., p. 103.
- · 1856. Perilampoidæ, Family IX., Förster, Hym. Stud., II., pp. 19, 22 and 46.
 - 1875. Perilampina, Tribus, Thomson, Hym. Skand., IV., pp. 11, 22.
 - 1886. Perilampinæ, Subfamily, Howard, Ent. Amer., I., p. 198.

1897. Perilampidæ, Family LXIV., Ashmead, Proc. Ent. Soc. Washington, IV., p. 245.

Francis Walker placed this family with the *Eucharidæ*, with which it is unquestionably closely allied. It is, however, easily separated from the *Eucharidæ* by many salient differences, and I agree with Dr. Förster in considering it a distinct family. It has some affinities allying it with the family *Miscogasteridæ*, the affinities existing also in the *Eucharidæ* and particularly through Cameron's genus *Orasema*.

Chrysolampus Spinola belongs to this family and not with the Pteromalidæ, where Dr. Von Dalla Torre has placed it. His changing the well-known subfamily Sphigigasterinæ into Chrysolampinæ, is therefore unnecessary and unwarranted. Chrysolampus is identical with Lamprostylus Förster.

The group attacks principally Lepidoptera, but will also attack other insects, as I have bred *Perilampus* sp. from Chrysopa cocoons.

The genera are not numerous and are characterized in the following table:

TABLE OF GENERA. 1. Abdomen petiolate..... 6 Thorax coarsely punctate. Antennæ 13-jointed. 4 (type S. fasciata Kriechbaumer). 4. Flagellum very short, compacted into a short club. Philomides Haliday (type P. paphius Haliday). Flagellum not very short, at the most subclavate... Perilampus Latreille (type Cynips italica Fabricius). 5. Antennæ inserted below the middle of the face, 13-jointed; stigmal and postmarginal veins abbreviated. Chrysomalla Förster (type C. roseri Förster). Antennæ pectinate. ♂ (♀ unknown) Aperilampus Walker (type Perilampus discolor Walker). (type C. splendidula Spinola). (type E. thenæ Walker). Family LXV. EUCHARIDÆ. 1846. Eucharidæ, Family 5 (partim), Walker, List. Chalc. British Museum, I., p. 21. 1856. Eucharoidæ, Familie 8, Förster, Hym. Stud., II., pp. 18, 22 and 42. 1886. Eucharine, Subfamily, Howard, Ent. Amer., I., p. 198. 1897. Eucharidæ, Family LXV., Ashmead, Proc. Ent. Soc. Washington, IV., p. 235. 1899. Eucharidæ, Family LXV., Ashmead, loc. cit., p. 245.

1900. Eucharidæ, Family LXV., Ashmead, Proc. U. S. National Museum, XXIII., p. 202.

In this family are found some of the most singular looking and wonderfully shaped Chalcids known, the structure of the thorax, and particularly of the scutellum, being most wonderfully and curiously modified and developed; and this development, in connection with the brilliant metallic green and blue colors of its members, makes the group the most striking and attractive of any in the Superfamily. Some of the species are now known to be parasitic upon ants and probably the whole group attacks these insects. In temperate regions the family is poorly represented, but in tropical countries, where ants most abound and flourish in enormous colonies, these insects are not rare and seem to have reached a very highly specialized development.

The known genera may be tabulated as follows:

TABLE OF GENERA.

TABLE OF GENERAL.
1. Females
Males
2. Antennæ 13-jointed or less
Antennæ 14-pointed or more.
Scutellum simple; antennæ 16–18-jointedEucharissa Westwood (type E. speciosa Westw.).
Scutellum produced posteriorly into a spine which is longitudinally striate; antennæ 14-jointed.
Saccharissa Kirby (type Eucharis contingens Walker).
3. Scutellum simple, neither bidentate nor produced into long processes
Scutellum bidentate or produced posteriorly into long processes over the abdomen
4. Antennæ moniliform 5
Antennæ not moniliform
5. Abdomen compressed, ascending Eucharis Latreille (type Cynips adscendens Fabr.).
Abdomen neither compressed nor ascending.
Hind tarsi with the first joint much thickened; antennæ 11-jointedTricoryna Kirby
(type Eucharis jello Walt.).
Hind tarsi with the first joint very long, but not thickened
(type Eucharis Zalates Walk.).
6. Joints of antennæ not serrate, cylindrical
Joints of antennæ serrate or subdentate
7. Antennæ 13-jointed, the joints short
Antennæ 11-jointed, the joints long.
Thorax smooth, polished; petiole of abdomen abruptly enlarged at apex.
Pseudometagea Ashmead (type Metagea schwarzii Ashm.).
Thorax rugose; petiole of abdomen normal, long and cylindricalPsilogaster Blanchard
(type P. cupreus Blanchard).
8. Thorax not greatly elevated, similar to Chrysolampus in the Perilampidæ, punctate and with complete
parapsidal furrows; mandibles long, acute at apex, the right mandible with two teeth within, the
left with one tooth within

9.	Autennæ 11-jointed
	Antennæ 13-jointed
10.	Scutellum rounded, not conically elevated posteriorly; wings hyaline. Pseudochalcura Ashmead g. nov.
	(type Eucharis gibbosa Provancher).
	Scutellum subconically elevated posteriorly; wings with a substigmal cloud or fascia. Chalcura Kirby
	(type Eucharis deprivata Walk.).
11	Scutellum with the processes very long, usually as long as the abdomen and sometimes very broad,
11.	
	forming a shield over the abdomen, or conically produced
	Scutellum bidentate, the processes never very long.
	Metathorax armed with strong lateral projections or teeth
	Metathorax unarmed, without teeth.
	A hump-like elevation above the metapleura
	(type Ichneumon cynipiformis Rossi).
	No hump-like elevation above the metapleuraSchizaspidia Westwood
	(type S. furcifera Westw.).
12.	Metathoracic processes curving downwards Lophyrocera Cameron (type L. stramineipes Cam.).
	Metathoracic processes consisting of two diverging horizontal teeth
	(type Schizaspidia plagiata Walk.).
13.	Scutellum not conically produced
	Scutellum conically produced over the abdomen.
	Head with a deep antennal furrow; hind femora very broad; abdomen subsessile, fusiform,
	depressed
14.	Scutellar processes long and slender, generally curving inward toward tips
	Scutellar processes very broad and covering the entire abdomen.
	Thorax not pubescent, the apex of the scutellar processes simple, or cleft or notched 15
	Thorax pubescent, the apex of the scutellar processes rounded and not sharply cleft, the notch
	extending two thirds the entire length
15	Scutellar processes long, broad and contiguous, but very flat, the extremities rounded, subtruncate, or
10,	furnished with two rounded short spines
	Scutellar processes not so shaped.
	Scutellar processes very broad, triangular Thoracantha Latreille (type <i>T. latreillei</i> Guérin).
	Scutellar processes long, contiguous and acutely pointed at tips, longitudinally striate.
	Uromelia Kirby (type Thoracantha striata Perty).
16.	Mesonotum and scutellum medially impressed; head almost as wide as the thorax; antennæ 10-jointed,
	the third joint as long as the scape, the following much wider than long Dicclothorax Ashmead
	(type D. platycerus Ashm.).
	Mesonotum and scutellum not so impressed, the scutellar processes having the basal portion as wide as
	the thorax, briefly compressed in the center, then dilated and at the apex furnished with two rounded
	short spinesLætocantha Shipp (type Thoracantha nasua Walk.).
17.	Antennæ 10-jointed, the first funicle joint the longest, the following short Dilocantha Shipp
	(type Thoracantha flavicornis Walk.).
18.	Head and eyes normal, not tuberculate
	Head and eyes tuberculate.
	Antennæ 12-jointed
19.	Antennæ 11-jointed, the third joint not much longer than the fourth 20

	Antennæ 10-jointed, the third joint very long, as long as all of the other joints united.
	Lirata Cameron (type L. luteogaster Cam.).
20	Thorax not pubescent, the scutellum always longitudinally striate
20.	(type Eucharis fuscata Fabr.).
	Thorax clothed with a fine pubescence, the scutellum smooth, not longitudinally striate, the processes
	smooth to their apices, where they are transversely serrateLasiokapala Ashmead
	(type L. serrata Ashm.).
21.	Scutellum spined, bidentate or produced into long processes extending over the scutellum
	Scutellum normal, simple. 23
22.	Scutellum bidendate or produced into long processes that extend over the abdomen
	Scutellum produced into a spine-like process.
	Antennæ never more than 13-jointed
	Antennæ 18-jointed
23.	Antennæ 10–13-jointed
	Antennæ 22-jointed Eucharissa Westwood.
24.	Antennæ simple, without branches
	Antennæ ramose or with branches
25.	Flagellar joints moniliform
	Flagellar joints cylindrical, not moniliform
26.	Abdomen compressed, ascending
	Abdomen neither compressed nor ascending.
	First joint of tarsi much thickened
	First joint of tarsi very long, slender
27.	Antennæ 10–11-jointed.
	Petiole of abdomen abruptly enlarged at apex; thorax smoothPseudometagea Ashmead.
	Petiole of abdomen normal, long, cylindrical; thorax rugosePsilogaster Blanchard.
	Antennæ 13-jointed, rather short; thorax closely punctate, the parapsidal furrows distinct; right man-
	dible with two teeth within, the left with one tooth withinOrasema Cameron.
28.	Scutellum spined, bidentate or produced into long processes that extend over the abdomen 29
	Scutellum normal, unarmed.
	Antennæ with 4 branches; wings hyaline
	Antennæ with more than four branches; wings with a substigmal cloud or fascia.
	Chalcura Kirby.
29.	Scutellum not conically produced into a spine
	Scutellum conically produced into a spine
30.	Scutellum with the processes very long, usually as long as the abdomen and sometimes very broad,
	forming a shield over the abdomen
	Scutellum bidentate, the teeth never very long.
	Metathorax armed with strong lateral projections or teeth
	Metathorax unarmed, without teeth.
	A hump-like elevation above the metapleura
	No hump-like elevation above the metapleura
31.	Metathoracic processes curving downwards; antennæ simpleLophyrocera Cameron.
	Metathoracic processes consisting of two horizontal teeth; antennæ with 9 branches.
	Tetramelia Kirby.

32.	Scutellar processes long and slender, generally curving inward toward tips
	Scutellar processes broad, contiguous their entire length or at least basally
	Scutellar process long, broad and contiguous, but very flat, the extremities rounded, subtruncate or
	furnished with two rounded, short spines
	Scutellar processes not so shaped.
	Scutellar process very broad, deeply, semicircularly emarginate at apex; antennæ with 9
	branches
	Scutellar processes long, triangularly pointed and longitudinally striate; antennæ with 8
	branches
	Thorax pubescent
	Thorax not pubescent.
	Mesonotum and scutellum medially impressed; antennæ 10-jointedDicælothorax Ashmead.
	Mesonotum and scutellum not impressed, the scutellar processes at base as wide as the thorax,
	briefly compressed in the center, then dilated and at apex furnished with two rounded, short
25	spines
55.	length
36.	Head and eyes normal, not tuberculate
00.	Head and eyes tuberculate
37.	Antennæ 11-jointed, the third joint not much longer than the fourth
	Antennæ 10-jointed, the third joint very long, as long as the other joints unitedLirata Cameron.
38.	Thorax not pubescent, the scutellum longitudinally striate
	Thorax clothed with a fine pubescence, the scutellum smooth, not striate, the apices of the scutellar
	processes serrate
	FAMILY LXVI. MISCOGASTERIDÆ.
183	33. Miscogasteridæ, Family 4 (partim), Walker, Ent. Mag., I, p. 370.
	66. Miscogasteroidæ, Familie 14 (partim), Förster, Hym. Stud., II, pp. 19, 24 and
100	51.
1.01	
	75. Pteromalina, Tribus (partim), Thomson, Hym. Skand., IV., pp. 12 and 216.
188	36. Pteromaline, subfamily (partim), Howard, Ent. Amer., I, p. 198.
189	97. Miscogasteridæ, Family LXVI., Ashmead, Proc. Ent. Soc. Washington, IV., pp. 235 and 245.
190	00. Miscogasteridæ, Family LXVI., Ashmead, Proc. U. S. National Museum,

XXIII., p. 202.

This family very closely resembles the family *Pteromalidæ*, and the two are separated with difficulty, the only reliable character to separate them being the number of apical spurs on the hind tibiæ. In this family the hind tibiæ have *two* apical spurs, while in the *Pteromalidæ* there is but *one* apical spur. It is a good character but not easily seen in the smaller species, and the greatest care and caution must be exercised in examining specimens before they can be placed in their proper families. A very strong lens is required to see the spurs and sometimes it will be found

necessary to use the compound microscope before the number of spurs, in these minute chalcidids, can be definitely settled.

Four distinct subfamilies, distinguished by the characters made use of in the following table, have been recognized:

TABLE OF SUBFAMILIES.

1.	Metathorax at apex produced beyond the insertion of the hind coxæ; the abdomen petiolate or sub-
	petiolate4
	Metathorax normal, not produced at apex
2.	Abdomen distinctly petiolate; if subsessile it is elongate and strongly carinate beneath
	Abdomen sessile or subsessile.
	Antennæ 8–11-jointed, inserted just above the clypeus or close to the mouth border.
	Subfamily I. PIRENINÆ.
	Antennæ 12-13-jointed, and most frequently inserted far above the clypeus, very rarely inserted
	just above the clypeus
3.	Antennæ 12-13-jointed; marginal vein always shorter than the subcostal, the costal cell normal
	second abdominal segment often large but not especially lengthened; ovipositor not exserted; meso-
	thoracic furrows most frequently completeSubfamily III. Miscogasterinæ.
4.	Antenuæ 13-14-jointed, subclavate, inserted below the middle of the face; front wings with the mar-
	ginal vein very long, usually fully as long as the subcostal vein; second abdominal segment much
	lengthened; ovipositor usually exserted; mesothoracic furrows incomplete; 3 antennæ often verti-
	cellate-pilose

SUBFAMILY I. PIRENINÆ.

- 1843. Pireniani, Tribus (partim), Haliday, Trans. Ent. Soc. London, III., p. 295.
- 1856. Pyrenoidæ, Familie (partim), Förster, Hym. Stud., II., pp. 18, 22 and 40.
- 1875. Pirenina, Tribus, Thomson, Hym. Skand., IV., pp. 12 and 187.
- 1886. Pireninæ, Subfamily (partim), Howard, Ent. Amer., I., p. 198.
- 1899. Pireninæ, Subfamily I., Ashmead, Proc. Ent. Soc. Washington, IV., p. 247.

This group is of small extent, although widely distributed. It is separated from the other subfamilies principally by the paucity of joints in the antennæ, and most of the species falling in it, whose parasitism is known, attack dipterous larvæ.

The genera *Calypso* and *Macroglenes* are easily separated by the different shaped heads in the males. Neither Haliday nor Thomson, however, give the characters to separate the females, and since I am only acquainted with *Macroglenes*, it has been impossible to give characters to separate the females.

TABLE OF GENERA.

1.	Females	2
	Males	9
2.	Eyes pubescent	3
	Eyes bare	5

3.	Abdomen with the second segment occupying about one half the whole surface or only a little more.
	Antennæ 11-jointed, the scape long, slender, the pedicel at least as long as the club; marginal
	vein not more than four times the length of the stigmal veinErotolepsia Howard
	(type E. compacta Howard).
	Antennæ 10-jointed, the scape short and slender, the pedicel shorter than the club; marginal
	vein long, about six times the length of the stigmal vein
	(type H. lucens Howard).
5.	Antennæ 10-jointed, with one or two ring-joints.
	Maxillary palpi 2-jointed
c	Maxillary palpi 4-jointed 6
0.	Ovipositor exserted. 7 Ovipositor not exserted.
	Postmarginal and stigmal veins very short.
	?
	?
7.	Antennæ with two ring-joints; postmarginal and stigmal veins very short
	(type P. varicornis Hal.).
	Antennæ with one ring-joint; postmarginal and stigmal veins long Ecrizotes Förster
	(type E. monticola Förster).
8.	Legs abnormal, the tibiæ strongly inflated or swollen, stouter than the femora, the tarsi short and
	slender, the joints very short; clypeus triangularly producedSpathopus Ashmead, gen. nov.
	(type S. anomalipes Ashm.).
9.	Eyes pubescent
	Eyes bare
10.	Antennæ 11-jointed; marginal vein not more than four times the length of the stigmal, the latter with
	a distinct club. Erotolepsia Howard.
	Antennæ 10-jointed; marginal vein about six times the length of the stigmal vein. Herbertia Howard.
11.	Antennæ 10-jointed, with one or two ring-joints.
	Maxillary palpi two-jointed
12	Eyes normal, not converging above. Calypso Haliday.
	Eyes abnormal, converging and nearly meeting above on the vertex
13.	Marginal vein not twice as long as the stigmal vein; flagellum not clavate Pirene Haliday.
	Marginal vein about twice as long as the stigmal vein, thickened at the base; flagellum short, clavate,
	the joints of the funicle moniliform, pilose
	Subfamily II. Tridyminæ.
18	35. Ormoceridæ, Family (partim), Walker, Ent. Mag., II., p. 167.
	56. Ormoceroidæ, Familie 15 (partim), Förster, Hym. Stud., II., pp. 19 and 24.
	56. Hormoceroidæ, Familie 15 (partim), Förster, opus cit., p. 59.
	75. Tridymine Tribus, (partim) Thomson, Hym. Skand. pp. 12 and 192.
	86. Tridymine, Subfamily, (partim) Howard, Eut. Amer., I., p. 198.
18	399. Tridyminæ, Subfamily II., Ashmead, Proc. Ent. Soc. Washington, IV., p. 247.

This subfamily seems to be a natural group of gall-inhabiting species, allied to the *Pirenine*, but easily separated by the structure of the antenne.

Two tribes may be distinguished:

TABLE OF TRIBES.

Mesonotum with incomplete furrows, indicated only anteriorly Tribe II. Metastenini

Tribe I. Tridymini.

The complete mesonotal furrows distinguish this tribe. Most of the species falling in this tribe are parasitic upon gall-making or gall-inhabiting Diptera, belonging to the family Cecidomyiida. Epocerus Mayr, however, is a genus living parasitically upon fig-insects in Brazil, and one or two exotic genera attack other gallinhabiting insects.

	TABLE OF GENERA.	
1.	Females	
	Males	
2.	Antennæ inserted near the mouth or just above the clypeus	
	Antennæ inserted on or near the middle of the face, far above the clypeus	
3.	Marginal vein normal	
	$ \begin{tabular}{lllllllllllllllllllllllllllllllllll$	
	(type S. americana Ashm.).	
4.	Clypeus at apex truncate or with a slight median sinus, never produced	
	Clypeus at apex triangularly produced.	
	Antennæ 12-jointed, the flagellum clavate, the joints of the funicle quadrate or transverse;	
	abdomen ovate or conic ovate	
5.	Head and thorax not umbilicately punctate, at the most finely punctate, shagreened or rugulose, some-	
	times smooth	
	Head and thorax umbilicately punctate.	
	Front wings by aline, sometimes with a smoky discoidal cloud, the marginal vein much longer	
	than the stigmal, the latter with an upward curve, the first marginal vein not longer	
	than the stigmal; antennæ 13-jointed with 2 ring-joints, the pedicel not long.	
	Decatomothorax Ashmead g. nov. (type D. gallicola Ashm.).	
6.	Head and thorax finely punctate or shagreened, rarely smooth	
	Head and thorax finely rugulose; marginal vein not longer than the stigmal vein, the latter straight,	
	but oblique, not curved, postmarginal vein longer than the stigmal; antennæ 13-jointed, with 2	
	ring-joints, the pedicel large, as long as or a little longer than the ring-joints and the first joint	
~	of the funicle united	
7.	Abdomen conically produced, the ovipositor exserted; antennæ 12-jointed, the funicle joints trans-	
	verse; marginal vein more than twice the length of the stigmal vein Gastrancistrus Westwood. (type G. vagans Westw.).	
	Abdomen short oval, above depressed, beneath boat-shaped; antennæ 13-jointed, the funicle 6-jointed,	
	the joints short, nearly cup-shaped	

8. Front wings normal
Front wings with the portion comprising the costal cell dilated and obliquely truncate at the juncture
of the submarginal vein with the marginal.
Antennæ 13-jointed, the flagellum dilated, the joints of funicle transverse, subpedunculate.
Epicopterus Westwood (type E. choreiformis Westw.).
9. Antennæ 13-jointed, with 2 or 3 ring joints
Antennæ 11- or 12-jointed
10. Thorax at most sparsely punctate, or almost smooth
Thorax slightly rugulosely punctate; antennæ 12-jointed; marginal vein about twice as long as the
stigmalSyntasis Walker (type S. encyrtoides Walk.).
11. Wings with marginal ciliæ
Wings without marginal ciliae.
Antennæ 12-jointed, with one ring-joint b
Antennæ 11- or 12-jointed, with two ring-joints.
Antennæ 11-jointed; abdomen as long as the head and thorax united, compressed.
Syntomocera Förster (type S. clavicornis Först.).
Antennæ 12 jointed; abdomen elongated, usually compressed and carinate beneath.
Asematus Förster (type A. amphibolus Först.).
b. Abdomen oblong, fully as long as the head and thorax united; head short, subconvex in front;
mesonotum not short, the furrows deep. Cecidoxenus Ashm. g. nov. (type C. nigrocyaneus Ashm.).
12. Antennæ 13-jointed, subclavate, the joints of the funicle, except the first, quadrate or nearly; meta-
thorax short with a median carina, the spiracles small, oval; head with sparse, thimble-like punc-
tures; abdomen conic-ovate
13. Antennæ with two ring-joints
Antennæ with three ring-joints.
Abdomen depressed, the ovipositor subexserted, never very long, at the most one third the
length of the abdomen, usually shorter
14. Metathorax short, with a median carina; abdomen compressed, above depressed, beneath keeled.
Terobia Förster (type T. dispila Först.).
Metathorax very short, without a median carina; abdomen subglobose or short oval; flagellum sub-
clavate, the pedicel large, the joints of the funicle small, submoniliform, increasing in size towards
the club
15. Antennæ inserted near the mouth or just above the clypeus
Antennæ inserted on or near the middle of the face, far above the clypeus
16. Marginal vein normal
Marginal vein abnormal, semicircularly thickened at the baseStigmatocrepis Ashmead.
17. Clypeus at apex truncate or with a slight median sinus, never produced
Clypeus at apex triangularly produced.
Antennæ 12-jointed, the flagellum filiform, pubescent or hairy, the funicle joints quadrate or
transverse quadrate, losely joined
18. Head and thorax not umbilicately punctate, at the most finely punctate, shagreened or rugulose,
sometimes smooth
Head and thorax umbilicately punctate.
Antennæ 13-jointed with two ring-joints Decatomothorax Ashmead.
19. Head and thorax finely punctate or shagreened, rarely smooth

	Head and thorax finely rugulose; marginal vein not longer than the stigmal, the latter straight but oblique, not curved, postmarginal vein longer than the stigmal; antennæ 13-jointed with two ringjoints
20.	Antennæ 12-jointed. Gastrancistrus Westwood. Antennæ 13-jointed
21	Front wings normal
	Front wings abnormal, the portion comprising the costal cell dilated and obliquely truncate at the juncture of the submarginal vein with the marginal; antennæ 13-jointed Epicopterus Westwood.
22.	Antennæ 13-jointed, with two or three ring-joints
23.	Thorax at most sparsely punctate or nearly smooth
	Thorax slightly rugulosely punctate; antennæ 12-jointed
24.	Wings with marginal ciliæ
	Wings without marginal cilie.
	Antennæ 12-jointed with one ring-joint
	Antennæ 11- or 12-jointed with two ring-joints.
	Antennæ 11-jointed, with two ring-jointsSyntomocera Förster.
	Antenuæ 12-jointed, with two ring-joints
25.	Antennæ 13-jointed
26.	Antennæ with two ring-joints
	Antennæ with three ring-joints
27.	Metathorax short, with a median carina
	Tribe II. Metastenini.
	The species falling in this tribe are easily separated from those in the tribe
\overline{Tr}	idymini by mesonotal characters, the parapsidal furrows being incomplete.
	TABLE OF GENERA.
1.	Females
	Males
2.	Antennæ 12-jointed, with two ring-joints
	Antennæ 13-jointed, with two ring-joints
3.	Flagellum incrassated; mandibles 3-dentate, the malar space not large; metanotum short, smooth, with a distinct median carina, the spiracles small; marginal vein longer than the stigmal vein, the post-
	marginal very long
	Flagellum at the most subclavate, the club 3-jointed; mandibles (?) 4-dentate, the malar space large; axillæ widely separated; metanotum punctate, with a median carina; marginal vein thickened, as long as the stigmal vein, the postmarginal longerDisema Förster (type D. pallipes Förster).
1	Tip of antennæ normal, not ending in a spine
4.	Tip of antennæ normar, not ending in a spine. Tip of antennæ ending in a spine, as in Rhaphiteles Walk., the flagellum long and slender, the funicle
	joints all long; left mandible 3-, the right 4-dentate; metathorax not short, without a median
	carina, the spiracles large, oval; abdomen large, depressed, very much longer than the head and
	thorax united
5.	Pronotum not distinctly separated
	Pronotum distinctly separated

6. Funicle filiform, the first joint large.
Marginal vein slender, always longer than the stigmal vein; abdomen ovate
Marginal vein thickened, not longer than the stigmal vein.
Body short; clypeus bidentate; mandibles 3-dentateXenocrepis Förster
(type Canocrepis arenicola Thoms.).
7. Abdomen with a yellow band at base; metathorax short, with a median carina and lateral folds; cly-
peus separated, anteriorly arcuateDimachus Thomson (type Pteromalus discolor Walk.).
Abdomen without a yellow band at base; metathorax not short, without a median carina; clypeus
separated, smooth, with a median tooth anteriorly. Hemitrichus Thomson (type $H.\ rufipes$ Thoms.).
8. Flagellum with the first joint short
Flagellum with the first joint long, cylindrical
9. Antennæ short, clavate in both sexes, inserted a little below the middle of the face; clypeus at apex
$truncate \ ; \ metathorax \ rather \ short, \ without \ lateral \ folds, \ the \ spiracles \ rounded.\dots \textbf{Habritus} \ Thomson$
(type Pteromalus brevicornis Ratzeburg).
Antennæ filiform, inserted on the middle of the face; clypeus at apex with a median incision; meta-
thorax not long, without a median carina, spiracles large, nearly linearDinarmus Thomson
(type D. acutus Thoms.).
10. Antennæ filiform, inserted on the middle of the face, the funicle joints all longer than thick; clypeus
anteriorly with a median sinus; metathorax not short, without lateral folds, median carina, or spir-
acular sulci, the spiracles oval
11. Antennæ 12-jointed, with two ring-joints.
Antennæ 13-jointed, with two ring-joints.
12. Marginal vein not thickened, longer than the stigmal vein; metanotum short, smooth but with a distinct median carina, the spiracles small
Marginal vein thickened, not longer than the stigmal vein; metanotum punctate, with a median
carina
13. Pronotum not distinctly separated
Pronotum distinctly separated
14. Marginal vein slender, always longer than the stigmal vein
Marginal vein thickened, not longer than the stigmal vein.
Clypeus bidentate; mandibles 3-dentate
15. Metathorax short, with a median carina
Metathorax not short, without a median carina
16. Antennæ inserted on the middle of the face, long
Antennæ inserted somewhat below the middle of the face
17. Metathorax without a median carina, the lateral folds present, the spiracles large, nearly linear.
Dinarmus Thomson.
Metathorax without a median carina, the lateral folds absent, the spiracles oval. Arthrolysis Förster.
SUBFAMILY III. MISCOGASTERINÆ.
1833. Miscogasteridæ, Family IV (partim), Walker, Ent. Mag., I., p. 370.
1835. Ormoceridæ, Family (partim), Walker, Ent. Mag., I., p. 167.
1835. Pteromalidæ, Family (partim), Walker, Ent. Mag., II., p. 286.

- 1856. Miscogasteroidæ, Family XIV (partim), Förster, Hym. Stud., II., pp. 19, 24 and 59.
- 1875. Pteromalina, Tribus (partim), Thomson, Hym. Skand., IV., pp. 12 and 216.
- 1885. Pteromalinæ, Subfamily (partim), Howard, Ent. Amer., I., p. 198; II., 1886, p. 33.
- 1885. Mischogastrides, Subtribus Thomson, Hym. Skand., IV., pp. 16 and 219.
- 1886. Mischogastrides, Tribe, Howard, Ent. Amer., II., p. 33.

This subfamily, although distinct, has affinities which ally it with the families *Perilampidæ* and the *Eucharidæ*, and also with the *Pteromalidæ*, through the subfamily *Sphegigasterinæ*. From the last mentioned it is separated by the *two*-spurred hind tibiæ, from the others by the cephalic, thoracic and abdominal differences brought out in my tables.

Two tribes may be recognized:

TABLE OF TRIBES.

Tribe I. Halticopterini.

The incomplete mesonotal furrows are sufficient to distinguish the tribe. The group is apparently parasitic upon Diptera belonging to the family Anthomyiidæ, and some are recorded from Lepidoptera and Hymenoptera. These latter records, however, are questionable and, additional evidence is needed before the true parasitism of these insects is definitely settled.

Many insects are found associated with the wood-boring Coleoptera, gall-making Diptera, Hymenoptera, Lepidoptera, etc., and it is not easy to tell correctly the host from which you breed several parasites.

Tribe II. Miscogasterini.

This tribe may be recognized by the *complete* mesonotal furrows; otherwise it is practically identical with the previous tribe, with similar habits.

	TABLE OF GENERA.		
1.	Females		
	Males		
2.	Pronotum not distinctly separated		
	Pronotum distinctly separated.		
	Mesothoracic lobes not convex; abdomen elongate, subcompressed, the petiole short.		
	Toxeuma Walker (type T. ericæ Walk.).		
3.	Mesothoracic lobes flat or at most subconvex, the furrows not deep, delicately impressed posteriorly. 4		
	Mesothoracic lobes convex, the furrows deep		
4.	Metathorax long, rugose, with a median carina and complete lateral folds; scutellum with a more or		
	less distinct cross-furrow before apex, the lateral margins convergent toward base.		
	Megorismus Walker (type M. aon Walk.).		
	Metathorax short, almost smooth, with a distinct median carina; scutellum with the lateral margins		
	nearly straight, not or only slightly convergent toward base		
	(type O. latus Walk.).		
5.	Petiole long; both mandibles 4-dentate		
	Petiole short or moderate; mandibles variable.		
	Left mandible 3-dentate, the right 4-dentate 6		
	Both mandibles alike, either 3- or 4-dentate		
6.	Petiole rugose or smooth; front wings with the stigmal vein ending in a small knob.		
	Lamprotatus Westwood (type L. splendens Westw.).		
	Petiole punctate, subdepressed; front wings with the stigmal vein ending in a large knob.		
	Dorsum serico-punctate		
	Dorsum squamo-punctateStictomischus Thomson (type S. scaposus Thoms.).		
7.	Both mandibles 3-dentate; stigmal knob small; elypeus transverse, separated, the anterior margin		
	truncate		
	Both mandibles 4-dentate; stigmal knob largeMiscogaster Walker (type M. hortensis Walk.).		
	Stigmal vein ending in a large knob		
9.	Pronotum not distinctly separated		
	Pronotum distinctly separated.		
	Both mandibles 4-dentate; flagellum hairy, the first joint not longer than wide; mesothoracic		
	lobes not convex		
10.	Mesothoracic lobes convex, the furrows deep		
	Mesothoracic lobes flat or at most subconvex, the furrows not deep, delicately impressed posteriorly.		
	Metathorax long, rugose, with a median carina and complete lateral folds; scutellum with a		
	cross-furrow before apex, the lateral margins convergent toward base Megorismus Walker.		
	Metathorax short, almost smooth, with a distinct median carina; scutellum with the lateral		
	margins nearly straight		
11.	Petiole long or short; both mandibles 4-dentate		
	Petiole short; both mandibles 3-dentate, or the left is 3-dentate, the right 4-dentate.		
	Left mandible 3-, the right 4-dentate		
	Both mandibles 3-dentate		

12.	Stigmal vein ending in a small knob; palpi normal	Lamprotatus Westwood.
	Stigmal vein ending in a large knob.	
	Palpi abnormal	Gitognathus Thomson.
	Palpi normal	Stictomischus Thomson.
13.	Stigmal vein ending in a small knob; palpi normal	Seladerma Walker.
14.	Stigmal vein ending in a large knob	Miscogaster Walker.

SUBFAMILY IV. LELAPINÆ.

1899. Lelapinæ, Subfamily IV., Ashmead, Proc. Ent. Soc. Washington, IV., p. 247. 1901. Lelapinæ, Subfamily IV., Ashmead, Faun. Hawaiiensis, I., p. 311.

This group reaches its greatest development in South America, where the species of *Lelaps* are numerous, although as yet only a few have been described.

The group is, I think, correctly placed in the family *Miscogasteridæ*. It shows some affinities with the *Cleonymidæ*, and with the *Pteromalidæ*, through the subfamily *Diparinæ*. The two spurred hind tibiæ, however, separate it from the latter, while other characters separate it from the *Cleonymidæ*.

The metathorax at apex is most frequently contracted into a neck, the usually conically produced abdomen being attached to this neck by a short petiole. The mesonotal furrows are complete; the axillæ are usually approximate, although separated at base of the scutellum, while the head, especially in the genus *Lelaps*, resembles somewhat that found among the *Cleonymidx*, the eyes being large and the occiput flat.

My recently characterized genus Apterolelaps is from North American, and superficially resembles Philachyra Haliday, a genus in the Eurytomida.

TABLE OF GENERA.

1.	Females	2
	Males	6
2.	Antennæ 14-jointed with 2 ring-joints	3
	Antennæ 12- or 13-jointed	
	Winged	
	Apterous.	

Abdomen conically pointed, the petiole distinct, a little longer than thick, the second segment occupying hardly half its surface; flagellum rather stout, subclavate, the joints fluted.

Apterolelaps Ashmead (type A. nigriceps Ashm.).

- 4. Abdomen conically produced at apex, and usually ending in a prominent ovipositor; second segment large, occupying fully half the surface, the third to fifth very short, the sixth and seventh together conical, longer than half the length of the second. Lelaps Haliday (type Merostenus sodates Walk.).

- 6. Petiole of abdomen long, the body small, spatulate; antennæ very long, 14-jointed, longer than the whole body, the joints long, cylindrical, clothed with long, sparse hairs.....Lelaps Haliday. Petiole of abdomen very short, the body oblong-oval, truncate at apex; antennæ not longer than the thorax, 13-jointed, the flagellum filiform, pubescent, the joints after the first about twice as long as thick....Mesolelaps Ashmead.

FAMILY LXVII. CLEONYMIDÆ.

- 1837. Cleonymidæ, Family (partim), Walker, Ent. Mag., IV., p. 349.
- 1846. Eupelmidæ, Family 9 (partim), Walker, List Chalcid. Brit. Museum, I., p. 52.
- 1856. Cleonymoidæ, Familie XIV. (partim), Förster, Hym. Stud., II., pp. 19, 24 and 46.
- 1875. Cleonymides, Subtribus, Thomson, Hym. Skand., IV., p. 217.
- 1878. Cleonymides, Subtribus, Thomson, Hym. Skand., V., p. 3.
- 1886. Cleonymides, Tribe, Howard, Entom. Amer., II., pp. 33, 34.
- 1899. Cleonymidæ, Family LXVI., Ashmead, Proc. Ent. Soc. Washington, IV., p. 200.

An historical sketch of this family was given in my paper entitled: "On the Genera of the Cleonymidæ," published in 1899.

Unquestionably, the family comes nearest to the family *Encyrtide*, and forms a connecting link between it and some families previously treated, *i. e.*, the *Chalcidide*, *Eurytomide* and the *Miscogasteride*; some genera in the subfamily *Chalcedectine* especially being remarkably like some genuine *Chalcidide*. Many males, too, are easily mistaken for genuine *Eupelmines* and *Encyrtines*. *Pelecinella* has some characters similar to the *Eurytomide*, and the *Torymide*.

Coleotrechnus, placed in this family, is unknown to me. It is placed here from the description alone, and may be a genuine Encyrtid, although nothing is said of a saltatorial middle tibial spur.

TABLE OF SUBFAMILIES.

- - Posterior femora not much swollen and very rarely toothed beneath, the anterior femora usually more or less enlarged, sometimes very much swollen and often excised or dentate beneath toward apex; ovipositor often, but not always, exserted; antennæ 11–13-jointed.

Subfamily II. CLEONYMINÆ.

- 3. Body of abdomen strongly compressed, sword-shaped, ending in a long ovipositor, the basal sheaths very broad; all legs slender, the hind pair very long, their coxe long, cylindrical; front wings with the marginal and postmarginal veins very long, the latter extending to tip of wing, the stigmal vein very small, subsessile; antennæ 11-jointed, inserted close to the mouth. Subfamily III. Pelecinellinæ.

SUBFAMILY I. CHALCEDECTINÆ.

- 1889. Polychromminæ, Subfamily, Ashmead, Proc. Ent. Soc. Washington, I., p. 226.
- 1895. Chalcedectinæ, Subfamily, Ashmead, Proc. Ent. Soc. Washington, III., p. 230.
- 1898. Chalcodectine, Subfamily, Dalla Torre, Cat. Hym., V., p. 186.
- 1899. Chalcedectinæ, Subfamily I., Ashmead, Proc. Ent. Soc. Washington, IV., p. 201.

The sessile abdomen and the greatly swollen and usually dentate or serrate hind femora, as in the *Chalcidida*, distinguish the family. It is not represented in Europe and has reached its greatest development in South America and Australia, where the species are evidently numerous. I have also seen an undescribed species from Africa, where it should be well represented.

TABLE OF GENERA.

T	. remates	4
	Males	7
2	. Hind femora much swollen, minutely denticulate beneath	5
	Hind femora much swollen and armed beneath with large, distinct teeth, or at least with one large tootl	h.
	Hind femora armed with 1 to 3 large teeth	3
	Hind femora armed with several teeth.	
	Abdomon depressed the fourth devel grown out the langest transversely stricts on a signlet	_

Abdomen depressed, the fourth dorsal segment the largest, transversely striate or aciculate-Chalcedectes Walker (type *C. maculicornis* Walker).

- 4. Abdomen oblong-oval, subcompressed beneath, nearly bare, and ending in a long ovipositor; head and thorax coarsely reticulately punctate; flagellum long, slender, filiform.....Chalcidiscelis Ashmead (type *C. koebelei* Ashm.).

Abdomen shorter than the thorax, compressed, the ovipositor hidden; mesonotum nearly smooth, or transversely striate or wrinkled; antennæ 12-jointed, the funicle 6-jointed, the joints transverse.

- 6. Abdomen ovate or conic-ovate.

1 Famala

Abdomen not depressed, convex beneath, the fourth dorsal segment longer than the third, the latter a little longer than the fifth; metathoracic spiracles reniform. Agamerion Haliday ¹ (type *Miscogaster gelo* Walk.).

Abdomen depressed, flat above and beneath, the third and fourth dorsal segments short, united shorter than the fifth; stigmal vein rather short; metathoracic spiracles oval.

Euchrysia Westwood (type E. cleptidea Westw.).

¹ Kirby has incorrectly classified this genus with the Chalcidinæ.

7. Hind femora much swollen, minntely denticulate beneath
Hind femora armed with 1 to 3 large teeth
Hind femora armed with several teeth
8. Hind femora with one large tooth
Hind femora with three large teeth
9. Head and thorax coarsely, reticulately punctate
Head and thorax not coarsely reticulately punctate, the mesonotum almost smooth.
Systolomorpha Ashmead.
10. Antennæ 11-jointed
Antennæ 10-jointed
11. Metathoracic spiracles reniform
Metathoracic spiracles oval
Subfamily II. Clennyminæ.
1897. Cleonyminæ, Subfamily II, Ashmead, Proc. Ent. Soc. Washington, iv, pp. 201, 202.
To this group belong the better known genera of the family, namely Cleonymus,
Cheiropachys, Trigonoderus, Acrocormus, etc., genera of world-wide distribution. It
is the largest group of the family and includes many genera and species. Most
of the species appear to attack only coleopterous larvæ and are of great economic
importance, since they destroy beetles destructive to our fruit, shade and forest trees.
TABLE OF GENERA.
1. Females
Males
2. Anterior femora more or less distinctly swollen, and never excised dentate beneath
Anterior femora much swollen, or excised dentate beneath
3. Pronotum not much narrowed and always wider than long
Pronotum much lengthened and narrowed, longer than wide.
Front femora greatly swollen, but not excised dentate beneath; abdomen conically produced,
but not much longer than the head and thorax united.
Heydenia Förster (type H. pretiosa Förster).
Front femora much swollen, and excised dentate beneath; abdomen elongate, conically produced.
Lycisca Spinola (type L. raptoria Spinola).
4. Eyes bare
Eyes pubescent.
Ovipositor very long
Ovipositor not prominent, at the most subexserted.
Abdomen subrotund, oblong or conic-ovate, the sides rounded, not carinated 5
Abdomen conic-ovate, or conically lengthened, the sides distinctly carinated.
Epistenia Westwood (type E. carulea Westw.).

5.	Labrum inconspicuous or hidden
	Labrum conspicuous.
	Abdomen conic-ovate
	Abdomen subrotund; antennæ 12-jointed, with three ring-jointsMicradelus Walker
	(type M. rotundus Walk.).
6	Abdomen with the first and fifth segments the longest; antennæ 11-jointed Belonea Westwood
-	
	(type B. australica Westw.).
	Abdomen with the first segment longer than the three following, the third produced into a sharp tri-
	angular point at the middle; antennæ 9-jointed Cameronella Dalla Torre, = Panthalis Cameron
_	(type P. blackburnii Cam.).
7.	Abdomen oblong or long-ovate; mesonotum with the furrows only slightly indicated anteriorly; fifth
	abdominal segment nearly as long as the first four segments united, the second and the third to-
	gether hardly longer than the fourth, the first and fourth subequal; front wings maculate.
	Ptinobius Ashmead (type Charitopus magnificus Ashm.).
8.	Winged 9
	Apterous.
	Abdomen ovate, ending in a long ovipositor; antennæ 13-jointed, with three ring-joints.
	Cea Haliday (type C. pulicaria Haliday).
9.	Abdomen conic-ovate, or conical, the terminal segment tubular, the ovipositor very long 10
	Abdomen as seen from above rotund, compressed or carinate beneath.
	Front wings hyaline, the stigmal vein hardly two thirds the length of the marginal, and a little
	shorter than the postmarginal; metathorax with lateral folds, the spiracles oval-elliptic.
	Tomicobia Ashmead (type T. tibialis Ashm.).
	Abdomen conic-ovate, the segments subequal, the ovipositor not exserted.
	Front wings with two transverse bands or maculæ; pronotum transverse-quadrate, narrowed
	medially; pedicel not lengthenedCheiropachys Westwood (type Sphex colon Linné).
	Front wings without bands or maculæ; pronotum transverse-quadrate, but not narrowed medially
	and well separated; pedicel much lengthenedSchizonotus Ratzeburg
10	(type S. sieboldii Ratzeb.).
10.	Last two abdominal segments very long, tubular. Thaumasura Westwood (type T. terebrator Westw.).
	Last five abdominal segments very slender, tubular. Solenura Westwood (type S. telescopica Westw.).
11.	Mesothoracic furrows complete
	Mesothoracic furrows incomplete, indicated only anteriorly.
	Pronotum short, narrowed medially
	Pronotum very long, conical
12.	Marginal vein not thickened
	Marginal vein thickened, shorter than the postmarginal. Zapachia Förster (type Z. spiloptera Först.).
13.	Abdomen oval, hardly as long as the thorax, above depressed
	Abdomen conical, longer than the thorax, the segments after the first, which is the longest, subequal.
	Front wings with one transverse band, the stigmal club largeAcrocormus Förster
	(type A. semifasciatus Thoms.).
	Front wings without a band, the stigmal club small. Caudonia Walker (type C. agylla Walk.).
14.	Front wings with a large, broad fuscous band beneath, the marginal and stigmal veins having a tri-
	angular hyaline streak within from the marginal vein; stigmal vein long, subclavate, as long as the
	marginal; funicle joints 3 to 6 a little wider than longBrachycaudonia Ashmead g. nov.
	(type B. californica Ashm.).
	(-7 2 - 2 - 2 - 3 - 7 - 7 - 7 - 7 - 7 - 7 - 7 - 7 - 7

15.	Abdomen ovate, shorter than the thorax, the segments subequal; middle tarsi incrassate. Notanisus Walker (type N. versicolor Walk.).
16	Abdomen sessile
	Abdomen petiolate
17.	Abdomen elongate, conically produced or acuminate at apex; postmarginal vein well developed. 18
	Abdomen long, conic-ovate, ending in a prominent ovipositor, which is dilated into three broad, leaf-like expansions, like a propeller in a naphtha launch. Dinoura Ashmead (type D. auriventris Ashm.). Scutellum without a transverse grooved line before tip; head triangular, narrowed anteriorly 21
	Scutellum with a transverse grooved line before the tip; head with rounded, convex cheeks.
	Pronotum transverse, not large
	Pronotum large, almost quadrate
19.	Pronotum very short, visible from above as a fine transverse line
	Pronotum transverse
20.	Antennæ 13-jointed; middle tibiæ normal; metanotum with a sharp median carina.
	Anoglyphis Förster (type A. nubilosa Först.).
	Antennæ 14-jointed; middle tibiæ much lengthened. Macromesus Walker (type M. amphiretus Walk.).
21.	Middle tibiæ not dilated at apex
	Middle tibiæ dilated at apex, their tarsi broad at base
	(type Prosopon montanus Walk.).
22.	Scutellum without a transverse grooved line before tip
	(type P. nubilosus Thoms.).
23.	Front femora not, or less distinctly, swollen, and never excised dentate beneath
	Front femora much swollen, and sometimes excised dentate beneath.
	Pronotum not much narrowed and always wider than long
	Pronotum much narrowed and lengthened.
	Front femora much swollen but not excised dentate beneath; abdomen clavate, de-
	pressed
	Front femora swollen and excised dentate beneathLycisca Spinola.
24.	Eyes bare
	Abdomen not carinate along the sides
25	Labrum inconspicuous or hidden.
20.	Labrum conspicuous.
	Metathorax with a median carina, the spiracles large, oblong or oval; flagellum subclavate,
	densely hairy, the joints of the funicle wider than long
	densely hairy, the joints of the funicle long
26.	Front wings bifasciate or maculate; marginal vein slender, about twice as long as the stigmal; pronotum not short; metanotum with a median carina; head lenticular, much wider than the thorax.
	Ptinobius Ashmead.
27.	Front wings bifasciate; marginal vein not longer than the stigmal, the latter long, strongly clavate;
	pronotum short, transverse, slightly narrowed; metanotum with a short median carina, the spiracles
	elliptic; head transverse; pedicel shorter than the first joint of the funicle. Cheiropachys Westwood.
	Front wings hyaline, not fasciate; marginal vein longer than the stigmal, the latter not especially long, ending in a small knob; pronotum large, quadrate, well-separatedSchizonotus Ratzeberg.

~	ASHMEAD: CLASSIFICATION OF THE CHALCID FLIES 285
28.	Mesonotum with the furrows complete
	Mesonotum with incomplete furrows, indicated only anteriorly.
	Marginal vein not thickened,
	Marginal vein thickened, shorter than the postmarginalZapachia Förster.
29.	Wings with a transverse band or fascia.
	Stigmal club very large
	Stigmal club small
	Wings hyaline, without a fascia.
	Stigmal club small
30.	Abdomen petiolate
	Abdomen sessile.
	Scutellum with a transverse grooved line before apex
0.1	Scutellum without a transverse grooved line before apex
31.	Pronotum very short, visible from above as a fine transverse line
	Pronotum not very short. Pronotum quadrate
	Pronotum transverse
32.	Metanotum not short, smooth and with a sharp median carina; antennæ 13-jointed.
ŭ - .	Anoglyphis Förster.
	Metanotum very short, closely punctate; antennæ 14-jointed
32.	Postmarginal vein well developed
	Postmarginal vein scarcely longer than the short stigmal vein with its knob; scutellum with two par-
	allel dorsal grooved lines; metanotum with a median carina; antennæDinoura Ashmead.
33.	Middle tibiæ not dilated at apex
	Middle tibiæ dilated at apex, the tarsi much thickened at base
34.	Scutellum without a transverse grooved line before the tip
	Subfamily III. Pelecinellinæ.
18	97. Pelecinellinæ, Subfamily III., Ashmead, Proc. Ent. Soc. Washington, IV., p. 201.
	This subfamily is at present represented by a single genus, <i>Pelecinella</i> Westwood.
קין.	aree species have been described, all from Brazil, and these are the largest and in
SOI	me respects the most striking looking Chalcid-flies known.
	The affinities of the group were discussed in my paper, "On the Genus Peleci-
ne	lla Westwood," published in 1897.
l l g f	rm very elongate; pronotum very long, longer and narrower than the mesonotum, contracted in front; nead with a deep frontal furrow; abdomen long, compressed, lanceolate, ending in a long ovipositor, and ongly petiolate; hind legs long, the coxe long and cylindrical, the tibiae longer than the femora, very gradually widened toward apex and terminating in two spurs, the tarsi slender, as long as the femora, the first joint longer than joints 2-5 united; stigmal vein very short, the marginal vein long, the postmarginal onger than the marginal

SUBFAMILY IV. COLOTRECHNINÆ.

1875. Colotrechnides, Subtribus, Thomson, Hym. Skand., IV., p. 217.

1878. Colotrechnides, Subtribus, Thomson, Hym. Skand., V., p. 46.

- 1886. Colotrechnides, Tribe, Howard, Ent. Amer., II., pp. 33 and 34.
- 1897. Colotrechninæ, Subfamily IV, Ashmead, Proc. Ent. Soc. Washington, IV., p. 201.

This group is unknown to me in nature. It is based upon Thomson's genus *Colotrechnus*, occurring in Sweden, who called it a subtribe.

Thomson's description clearly indicates that it belongs to the family *Cleonymidæ*, although the absence of mesonotal furrows is strongly suggestive of the *Encyrtidæ*.

Wings with the stigmal and postmarginal veins very short, the knob of the former rounded, subsessile; frontal depression long; antennæ 12-jointed, inserted below the middle of the face, the funicle 5-jointed; hind tibiæ compressed, the hind margin denticulate.. Colotrechnus Thomson (type C. subcærulens Thoms.).

FAMILY LXVIII. ENCYRTIDÆ.

- 1837. Encyrtidæ, Family (partim), Walker, Ent. Mag., IV., p. 439.
- 1840. Encyrtidæ, Subfamily 4, Westwood, Intro. Mod. Classif. Ins., II., p. 166; Synop., p. 66.
- 1846. Eupelmidæ, Family 9 (partim), Walker, List Chalc. Brit. Museum, I., p. 52.
- 1846. Encyrtidæ, Family (partim), Walker, List Chalc. Brit. Museum, I., p. 53.
- 1848. Pteromalidæ, Family V. (partim), Walker, List Chalc. Brit. Museum, II., p. 104.
- 1856. Eupelmoide, Familie IV. (partim), Förster, Hym. Stud., II., pp. 18, 21 and 30.
- 1856. Encyrtoide, Familie V. (partim), Förster, Hym. Stud., II., pp. 18, 21 and 32.
- 1875. Encyrtina, Subtribus (partim), Thomson, Hym. Skand., IV., pp. 12 and 112.
- 1885. Encyrtinæ, Subfamily (partim), Howard, Ent. Amer., I., pp. 198, 216.
- 1897. Encyrtidæ, Family LXVIII., Ashmead, Proc. Ent. Soc. Washington, IV., p. 236.
- 1900. Encyrtidæ, Family LXVIII., Ashmead, Proc. U. S. Nat. Museum, XXII., p.

This family was very fully characterized and discussed in my paper entitled "On the Genera of the Subfamily Encyrtine," published in the Proceedings of the U. S. National Museum for 1900. It is unnecessary, therefore, to repeat the characterization of the group, since the classification here is practically identical, the only change being the establishment of a new tribe in the *Eupelmine*, and some new genera in the various tribes.

TABLE OF SUBFAMILIES.

Subfamily I. EUPELMINÆ.

SUBFAMILY I. EUPELMINÆ.

- 1846. Eupelmidæ, Family (partim), Walker, Ann. & Mag. Nat. Hist., XVII., p. 114.
- 1856. Eupelmoidæ, Familie 4, Förster, Hym. Stud., II., pp. 18, 21 and 30.
- 1875. Eupelmina, Tribus, Thomson, Hym. Skand., IV., pp. 11 and 102.
- 1886. Eupelminæ, Subfamily, Howard, Ent. Amer., I., p. 198.
- 1897. Eupelminæ, Subfamily I., Ashmead, Proc. Ent. Soc. Washington, IV., p. 238.

This subfamily is quite distinct from the other two subfamilies, and is easily recognized by the structural peculiarities of the mesonotum brought out in my table of subfamilies.

A full account of the group is given in my paper entitled, "On the Genera of the Eupelmine," published in the Proceedings of the Entomological Society of Washington for 1896. Since that paper was published, however, a new tribe and some new genera have been recognized; these are characterized below.

TABLE OF TRIBES.

Tribe I. Eupelmini.

The impressed and incomplete mesonotal furrows in the females distinguish the group. The males are not so readily defined, and are easily mistaken for males in the family *Cleonymidæ*, the mesonotum being sometimes subconvex, with the furrows complete or incomplete; the mesopleura are, however, usually *entire* and this peculiarity, together with the venation, the structural characters of the head, the antennæ and the metathorax, will, in most cases, distinguish these insects.

TABLE OF GENERA.

1.	Females	. 2
	Males	37
2.	Hind tibiæ and first tarsal joint compressed and broad	. 3
	Hind tibiæ and first tarsal joint neither compressed nor broad (rarely with the hind tibiæ slightly compressed nor broad)	om-
	pressed)	. 4

S	3.	Eyes hairy; antennæ 13-jointed; axillæ meeting at base of scutellum
		(type M. spectabilis Westw.).
4		Front femora much swollen
5		Winged; front femora armed with minute spines beneath; ovipositor very longOodera Westwood
		(type O. gracilis Westw.).
		Wingless; front femora unarmed; ovipositor subexserted; head large, quadrate; eyes rounded, bare;
		temples broad
		First tarsal joint of middle legs without strong spines beneath, at most with hairs
ť		
		First tarsal joint of middle legs with strong spines or minute black teeth beneath
• 7	7.	Mesonotum not impressed; axillæ triangular, meeting at base of scutellum Charitopus Förster
		(type C. fulviventris Först.).
8	3.	Face deeply excavated, the front ocellus always placed in the furrow
		Face rarely deeply excavated, although often with deep antennal furrows, the front ocellus never
		placed in the furrow
ę	9.	Middle tibiæ very long
		Middle tibiæ not very long
10	0.	Antennæ inserted near the border of the mouth Stenoceroides Dalla Torre = Stenocera Walker
		type S. walkeri Curtis).
		Antennæ inserted far above the mouth border; postmarginal vein greatly lengthened.
		Polymoria Förster (type P. coronata Thomson).
11	1	Axillæ not united at base of the scutellum, their inner suture strongly curved; postmarginal vein very
1,	١.	short, scarcely developed, or rarely longer than the stigmal vein Eusandalum Ratzeburg
70	,	= Balcha Walker $=$ Ratzeburgia Förster (type E. abbreviatum Ratz.).
12	۷.	Eyes hairy or pubescent
		Eyes bare
13	3.	Scutellum with a broad base against the mesonotum, the axillæ being widely separated 26
		Scutellum with a narrow base against the mesonotum, the axillæ approximate or united at base of scutellum
14	4.	Hind tibiæ with 2 apical spurs
		Hind tibiæ with 1 apical spur
1.0	5	Antennæ inserted below the middle of the face; stigmal vein very long, curved Calosoter Walker
Τ,	υ.	
		(type Pteromalus eneubalus Walk.).
		Antennæ inserted above the middle of the face; stigmal vein very short
	_	(type C. eques Haliday).
10	6.	Head large, transverse, wider than the thorax, the eyes large, oblong oval, convergent above, the
		vertex, however, not especially narrow, the lateral ocelli close to the eyes but not touching the inner
		margin; antennæ subclavate, inserted a little below the base of the eyes, and widely separated;
		abdomen depressed, not longer than the thorax, the ovipositor hidden Solindenia Cameron
		(type S. picticornis Cam.).
17	7.	Second dorsal abdominal segment short, not incised at apical margin
		Second, third and fourth dorsal abdominal segments usually incised medially at apical margin, the
		second the largest segment
18	8.	Stigmal vein not short; abdomen oval, narrower than the thorax, ovipositor exserted.
		Brasema Cameron (type B. brevispina Cam.).

19.	Abdomen at the most with dorsal segments 1 to 3 incised at apical middle; sometimes with only the first and second incised
	Abdomen with dorsal segments 2 to 5 incised or emarginate at apical margin
20	Second abdominal segment not as long as all the segments united
20.	Second abdominal segment as long as all the segments united
21	Eyes neither especially large nor strongly convergent above (although somewhat convergent), the ver-
	tex not very narrow, the hind ocelli not approximate
	Eyes very large, strongly convergent above, the vertex narrow, the hind ocelli very approximate, the
	front ocellus placed far anteriorly
22.	From with a deep \(\Lambda\)-shaped antennal furrow; antennæ 13-jointed, ringed with white, inserted close to
	the mouth
	From deeply grooved; antennæ 13-jointed, but not ringed with white, clavate, obliquely truncate at
	apex from beneath, inserted on or near the middle of the face; abdomen longer than the head and
	thorax united, the dorsal segments 1-3 incised at apical middle
	(type M. brasiliensis Ashmead)
23.	Abdomen spatulate; occiput with a bunch of deep black bristles behind the ocelli.
	Tineobius Ashmead (type T. citri Ashmead).
	Abdomen long, oblong-oval; occiput normalIschnopsis Ashmead (type I. ophthalmica Ashmead).
24.	Eyes converging above; antennæ inserted on the middle of the face Lutnes Cameron
	(type L. ornaticornis Cam.).
25.	Scape long and more or less compressed; postmarginal vein very long, the stigmal vein curved, not
	short
26.	Wingless or subapterous
	Winged
27.	Metathoracic angles normal; antennæ inserted only a little below the middle of the face, never close to the mouth border; face without transverse furrows
	Metathoracic angles spined; antennæ inserted close to the mouth border; face with transverse furrows.
	Myrmecomimesis Dalla Torre (type Myrmecopsis nigricans Walk.).
28.	Abdomen with dorsal segments 2 to 6 not incised at apical middle Eupelminus Dalla Torre
	(type Urocryptus excavatus Westw.).
	Abdomen with dorsal segments 2 to 6 more or less incised or emarginate at apical middle (apterous
	forms)Eupelmus Dalman.
29.	Abdomen long. conic-ovate, oblong, or conically acuminate, as long or much longer than the head and
	thorax united, the dorsal flap always deeply incised at apical middle
	Abdomen clavate or spatulate, broadened behind, narrowed toward the base, not as long as the thorax or shorter than the head and thorax united, depressed or flat above, the dorsal flaps not incised or
90	the incision is not very deep
ου. _.	Ovipositor shorter than the body, usually shorter than the abdomen
91	Ovipositor always longer than the entire body, usually very much longer
51.	Antennæ inserted a little below the middle of the face, on or above an imaginary line drawn from the
	base of the eyes, rarely a little below it
	Antennæ inserted above the middle of the face, or at least never below the middle. A villed widely separated at least of contallum, wings not shout, the magginal vain lengt the stig-
	Axillæ widely separated at base of scutellum; wings not short, the marginal vein long, the stigmal vein very short, the postmarginal long; antennæ 13-jointedCharitolophus Förster
	(type C. carulescens Först.).
	Axillæ approximate; wings short, somewhat narrowed; antennæ 9-jointed (teste Motschulsky). Cacotropia Motschulsky (type C. echidna Motsch.).

32. Scape compressed, extending far beyond the ocelli; scutellum without a tuft of long stiff bristles at apex; abdomen elongate, the dorsal flap and segments 2-4 incised at apical middle; ovipositor very much longer than the entire insect
much longer than the entire insect
Scape long, slender, cylindrical, extending only a little above the ocelli; scutellum with a tart of long, stiff black bristles, as in Eacytus Latr.; abdomen not so clongate, segments 2-5 at apex, excised medially; ovipositor a little longer than the entire insect; front wings with a broad fuscous band across the middle
stiff black bristles, as in Encyrtus Latr.; abdomen not so elongate, segments 2-5 at apex, excised medially; ovipositor a little longer than the entire insect; front wings with a broad fuscous band across the middle
medially; ovipositor a little longer than the entire insect; front wings with a broad fuscous band across the middle
across the middle
33. Head viewed from in front normal, at least as long as wide, or at least only a little wider than long; antennal furrows not very deep and very short; eyes oblong or ovate
antennal furrows not very deep and very short; eyes oblong or ovate
Head viewed from in front about twice as wide as long, the antennal furrows very deep; eyes round, strongly convergent above; postmarginal vein not longer than the stigmal. Lecaniobius Ashmead (type L. cockerellii Ashm.). 34. Scutellum normal, without a tuft of hairs
strongly convergent above; postmarginal vein not longer than the stigmal. Lecaniobius Ashmead (type L. cockerellii Ashm.). 34. Scutellum normal, without a tuft of hairs. 35. Scutellum with a fascicle of hairs; club of antennæ compressed. Hoplopsis Destefani (type H. mayri Destefani). 35. Malar furrow distinct; no carina from the lower part of each eye to base of each antennæ; antennæ inserted on or somewhat below an imaginary line drawn from base of eyes, rarely slightly above this line. Anastatus Motschulsky (type A. mantoidæ Motsch.). Malar furrows indistinct or subobsolete; a distinct carina extends from the lower part of each eye to the base of each antenna; antennæ inserted just above the clypeus. Arachnophaga Ashmead (type Eupelmus piceus How.). 36. Hind tibiæ and first tarsal joint compressed, broad 37. Hind tibiæ and first tarsal joint simple, the tibiæ rarely slightly compressed, never broad, the first tarsal joint always cylindrical 38. Front femora much swollen 39. Front femora much swollen 39. Front femora much swollen 39. Front femora armed with minute spines beneath. Oodera Westwood. Front femora normal 40. Antennæ armed with minute spines beneath. Oodera Westwood. Front femora not armed with minute spines beneath. Oodera Westwood. Front femora mose or branched. 41. Antennæ simple, without branches. 42. 41. Flagellum with four branches. Chirolophus Haliday (type C. cerulescens Först.). 42. Antennæ inserted near the middle of the face or above an imaginary line drawn from the base of the eyes 48. Antennæ inserted just above the clypeus or below an imaginary line drawn from the base of the eyes. 48.
(type L. cockerellii Ashm.). 34. Scutellum normal, without a tuft of hairs
34. Scutellum normal, without a tuft of hairs
Scutellum with a fascicle of hairs; club of antennæ compressed. (type H. mayri Destefani). 35. Malar furrow distinct; no carina from the lower part of each eye to base of each antenna; antennæ inserted on or somewhat below an imaginary line drawn from base of eyes, rarely slightly above this line
(type H. mayri Destefani). 35. Malar furrow distinct; no carina from the lower part of each eye to base of each antenna; antennæ inserted on or somewhat below an imaginary line drawn from base of eyes, rarely slightly above this line
35. Malar furrow distinct; no carina from the lower part of each eye to base of each antenna; antennae inserted on or somewhat below an imaginary line drawn from base of eyes, rarely slightly above this line
inserted on or somewhat below an imaginary line drawn from base of eyes, rarely slightly above this line
this line
Malar furrows indistinct or subobsolete; a distinct carina extends from the lower part of each eye to the base of each antenna; antennæ inserted just above the clypeus
the base of each antenna; antennæ inserted just above the clypeus
(type Eupelmus piceus How.). 36. Hind tibiæ and first tarsal joint compressed, broad
36. Hind tibiæ and first tarsal joint compressed, broad
Hind tibiæ and first tarsal joint simple, the tibiæ rarely slightly compressed, never broad, the first tarsal joint always cylindrical
tarsal joint always cylindrical
37. Eyes hairy; flagellum subclavate, obliquely truncate at tip. Metapelma Westwood 38. Front femora much swollen
38. Front femora much swollen
Front femora normal
Front femora not armed with minute spines beneath. 40. Antennæ ramose or branched. 41. Antennæ simple, without branches. 42. Flagellum with four branches. Eyes bare. Chirolophus Haliday (type C. eques Hal.). Eyes hairy. Chiritolophus Förster (type C. cærulescens Först.). 42. Antennæ inserted near the middle of the face or above an imaginary line drawn from the base of the eyes. Antennæ inserted just above the clypeus or below an imaginary line drawn from the base of the eyes.
40. Antennæ ramose or branched
Antennæ simple, without branches. 42 41. Flagellum with four branches. Eyes bare. Chirolophus Haliday (type C. eques Hal.). Eyes hairy. Chiritolophus Förster (type C. eærulescens Först.). 42. Antennæ inserted near the middle of the face or above an imaginary line drawn from the base of the eyes. Antennæ inserted just above the clypeus or below an imaginary line drawn from the base of the eyes. 48
41. Flagellum with four branches. Eyes bare. Chirolophus Haliday (type C. eques Hal.). Eyes hairy. Chiritolophus Förster (type C. cærulescens Först.). 42. Antennæ inserted near the middle of the face or above an imaginary line drawn from the base of the eyes. 43. Antennæ inserted just above the clypeus or below an imaginary line drawn from the base of the eyes.
Eyes bare
Eyes hairy. Chiritolophus Förster (type C. cærulescens Först.). 42. Antennæ inserted near the middle of the face or above an imaginary line drawn from the base of the eyes
42. Antennæ inserted near the middle of the face or above an imaginary line drawn from the base of the eyes
eyes
Antennæ inserted just above the clypeus or below an imaginary line drawn from the base of the eyes. 48
43. Mesonotal furrows incomplete or wanting at the most vaguely impressed or indicated only anteriorly
and converging and ending near the middle of the scutum
Mesonotal furrows distinct, entire
44. Axilla united or not widely separate at the base of the scutellum
Axillæ well separated at base of the scutellum.
Stigmal and postmarginal veins short, the latter the shorter, always much abbreviated; hind
sutures of axillæ curved; scape not compressedEusandalum Ratzeburg.

	ASHMEAD: CLASSIFICATION OF THE CHALCID FLIES 29
45.	Hind tibiæ not compressed4
	Hind tibiæ compressed.
	Pedicel not small, obconical, larger than the first joint of the flagellum.
46.	Eyes pubescent
47.	Postmarginal vein long, twice or nearly twice as long as the stigmal vein; scape short; flagellum fi
	iform, clothed with a dense pubescence; pedicel minute.
	Joints 1-7 of funicle always longer than thick, the club-joints not very long.
	Cerambycobius Ashmead
	Joints of funicle very short, thicker than long, the club-joints usually very long.
48.	Anastatus Motschulsky Hind tibiæ somewhat compressed.
	Pedicel obconic, smaller than the first joint of the funicle, the joints of the flagellum, except some
	times 6 and 7, longer than thick; dorsal abdominal segments not incised medially at apex.
	Arachnophaga Ashmead
	Tribe II Tangostiamini

This little group is allied to the subfamily Encyrtine, in which group Dr. Howard first placed his genus Tanaostigma, and also to the family Cleonymidæ, where, deceived by a male specimen, I first placed the genus Eutrichosoma. Additional specimens, and the discovery of two new genera have enabled me to see more clearly the affinities and relationship of the group to other chalcidids, and I believe other discoveries will confirm my views in assigning it a position with the Eupelminæ rather than with the Encyrtinæ.

TABLE OF GENERA.
1. Female
Males
2. Scape of antennæ slender, not at all dilated
Scape of antennæ broadly dilated beneath, or dilated, or compressed its entire length.
Scape compressed or dilated its entire length
Scape broadly dilated beneath; flagellum flattened, the joints of the funicle subpedunculate
and much wider than long; postmarginal vein shorter than the stigmal, the latter long;
postmarginal vein shorter than the stigmal, the latter long, nearly perpendicular with the
front margin; abdomen not longer than the thorax, the ovipositor slightly exserted.
Tanaostigma Howard (type T. coursetiæ Howard).
3. Flagellum subclavate, the joints of the funicle cylindrical, a little longer than thick; postmarginal vein
about as long as the stigmal vein, the latter not short; body bare; abdomen as long as or a little longer
than the head and thorax united
Flagellum subcompressed, the funicle joints, or at least 1 to 3, wider than long; body well clothed with
short, scale-like white hairs; abdomen subglobose, scarcely as long as the thorax, the ovipositor
subexserted
4. Body clothed with short scale-like white hairs; scape very slender, the flagellum stout, pubescent, the
joints wider than long; wings glabrous, the stigmal vein ending in a knob, slightly curved and as long
as the marginal vein, the postmarginal vein wantingEutrichosoma Ashmead
(type E. mirabile Ashm.).

5. Flagellum filiform, without branches
Flagellum with four branches.
Body bare or nearly.
Branches of flagellum long
Branches of flagellum short
Body well clothed with short, stout, scale-like white hairs
6. Body well clothed with short, stout, scale-like white hairs; wings glabrous, the stigmal vein curved, as
long as the marginal vein and ending in a knob, the postmarginal vein absent; scape very slender,
the joints of the funicle much wider than long and briefly but distinctly pedicellate. Eutrichosoma Ashmead.
Subfamily II. Encyrting.
1840. Encyrtides, Subfamily 4 (partim), Westwood, Intro. Mod. Class Ins. Synop., p. 72.
1856. Encyrtoidæ, Familie 5, Förster, Hym. Stud., I., p. 18.
1875. Encyrtina, Tribus, Thomson, Hym. Skand., IV., pp. 12 and 112.
1886. Encyrtinæ, Subfamily, Howard, Ent. Amer., I., p. 198.
1897. Encyrtinæ, Subfamily II., Ashmead, Proc. Ent. Soc. Washington, IV., p. 248.
1900. Encyrtinæ, Subfamily II., Ashmead, Proc. U. S. Nat. Mus., XXIII., p. 324.
This subfamily was fully characterized in my paper, "On the Genera of the En-
cyrtinæ," published in 1900.
The four tribes into which it was divided may be recognized by the aid of the
following table:
TABLE OF TRIBES.
1. Mandibles bi- or tri-dentate, or broadly truncate at apex, never acute; tarsi always 5-jointed 2 Mandibles dentate contact apex.
Mandibles dentate, acute at apex
Mandibles at apex tridentate, the teeth sometimes very minute; labrum usually conspicuous 4
3. Mandibles not stout, or only moderately so, rather long and always bidentate at apex; labrum free;
abdomen in females with the hypopygium large, lanceolate or plowshare-shaped, inclosing the ovi-
positor, and extending beyond the anus; the second segment most frequently large; antennæ usually
inserted just above the elypeus, rarely just below the middle of the face. Tribe I. Eetromini.
Mandibles stout, but short and polished, the apex broadly truncate, unarmed or nearly so; labrum
conspicuous; abdomen with the hypopygium less evidently prominent, not projecting; body usually
stout, not metallic; hind tibiæ with two spurs; antennæ inserted below the middle of the face. Tribe II. Encyrtinæ.
4. Hind tibiæ with one apical spur; hypopygium not prominent; body most frequently, but not always
metallie; antennæ variable
5. Tarsi 4- or 5-jointed; marginal vein punctiform, or subobsolete Tribe IV. Arrhenophagini.
Tribe I. Ectromini.

In this tribe the species are usually more elongate and narrower, the marginal vein proportionately longer, with the stigmal vein shorter, while the mandibles are

	ways narrower and bidentate. In the females the hypopygium is usually
pro	ominent. TABLE OF GENERA.
	Females
2.	Face with a distinct carina between the base of the antennæ
	Face without such a carina, rarely with a rounded ridge; antennæ inserted just above the clypeus, or below the middle of the face.
	Wingless or subapterous species
	Front wings with the marginal vein rather long, twice as long as the stigmal vein, or even longer, always much longer than the stigmal
	Front wings with the marginal vein short, the postmarginal vein very short
	longer than the stigmal
	Wings fuscous, marked with white bands or rays; from broad, the lateral ocelli nearer to the
	eye margin than to the front ocellus. Calocerinus Howard (type Tetracnemus floridanus Ashm.).
	Wings hyaline; from not so broad, the lateral occili not nearer to the eye margin than to the front occilius
5.	Funicle 6-jointed, without ring-joints
	Funicle 4-jointed, with two ring-joints.
	From minutely shagreened, with minute punctures scattered over the surface; scape slender, cylindrical, the flagellum at the most subclavate; stigmal vein very oblique, subclavate.
6.	Meromyzobia Ashmead (type <i>Ericydnus_maculipennis</i> Ashm.). Stigmal and postmarginal veins short, the latter sometimes hardly developed; front wings with a dis-
	coidal blotch
	Stigmal and postmarginal veins not short, usually long, the latter the longer, sometimes as long as the marginal; front wings without a discoidal blotch
7.	From very minutely shagreened, with minute punctures scattered over the surface, or almost smooth.
	Head viewed from in front longer than wide; scutellum with a tuft of long hairs; abdomen scarcely longer than the head and thorax united, the ovipositor not or scarcely exserted;
	flagellum gradually broadened towards apex, compressed, the pedicel hardly as long as the
	first joint of the funicle; the joints after the third broader than long.
	Chrysopophagus Ashmead (type <i>C. compressicornis</i> Ashm.). Head viewed from in front not longer than wide, if anything a little wider than long; scutellum
	without a tuft of long hairs; abdomen distinctly longer than the head and thorax united, with
	a prominent ovipositor which is longer than half the length of the abdomen; flagellum sub-
	clavate, not compressed, the funicle joints longer than thickTineophoctonus Ashmead
Q	(type <i>Phænodescus armatus</i> Ashm.). Frons regularly punctate, or broad and smooth, margaritaceously shining
0.	From minutely shagreened, with minute punctures scattered over the surface; scape not compressedly
	dilated beneath, either cylindrical or subcylindrical.
	Antennæ not longer than the body, usually somewhat shorter, the first joint of the flagellum
	rarely more than twice as long as thick; stigmal vein not curved; axillæ just meet at inner basal angles

	Antennæ longer than the body, the first joint of the flagellum about five times as long as thick;
	stigmal vein gently curved; axillæ unite and form a slight ridge at base of scutellum.
	Leptomastix Förster (type L. histrio Mayr).
9.	From regularly punctate; scape beneath broadly compressedly dilated, the flagellum long, filiform,
	cylindrical; scutellum triangular, acute at apex, the axillæ separatedDinocarsis Förster
	(type Encyrtus hemipterus Dalm.).
	From broad and smooth, margaritaceously shining, or at the most feebly shagreened; scape long,
	slender, the flagellum long, subcylindrical, feebly compressed, the first joint the longest, somewhat
	more than twice as long as thick; scutellum bifoveate at base Ectroma Westwood
	(type Eupelmus rufus Dalm.).
10.	Frons finely shagreened or alutaceous, subopaque; lateral ocelli close to the eye margin; scape
	usually broadly compressedly dilated beneath, the flagellum slender, cylindrical; axillæ not quite
	meeting at inner basal angles; front wings with a hairless line extending obliquely inward from the
	stigmal vein
	Frons narrow, almost smooth; lateral occili close to the eye margin; scape broadly dilated beneath,
	the flagellum compressed, fusiform, as seen from the side; axillæ meet at inner basal angle.
	Anusia Förster (type Ectroma fulvescens Westw.).
11	Frons regularly punctate, coriaceous or shagreened, with distinct scattered punctures over the sur-
11.	face
10	From smooth, margaritaceously shining, or at the most microscopically shagreened
12.	Scutellum triangular, acute at apex; scape dilated and compressed beneath Dinocarsis Förster.
	Scutellum subtriangular, rounded, not acute at apex; scape slender, cylindrical or at most subclavate.
	Flagellum filiform or subclavate, not compressed; axillæ touching each other at base of scutellum.
	Funicle 4-jointed, with 2 ring-joints; ocelli normal, the lateral close to the eye margin,
	but not touching it
	Funicle 6-jointed, with no ring-joint; occili very minute, the lateral lying close to the eye
	margin
	Flagellum compressed; axillæ separated, not touching each other at base of scutellum; lateral
	ocelli not close to the eye margin; ovipositor exserted, the hypopygium very prominent.
10	Henicopygus Ashmead (type H. subapterus Ashm.).
13.	Scutellum subtriangular; head transverse.
	Scutellum without foveæ
	Scutellum bifoveate at base.
	Scape and flagellum not at all compressed, cylindricalEctroma Westwood.
14.	Scutellum normal; scape broadly dilated beneath, the flagellum compressed, fusiform.
	Anusia Förster.
	Scutellum lunate; head seen from above subquadrate, wider than the thorax, the lateral ocelli rather
	close to the eye margin; thorax with a silvery pubescence
	(type B. pascuorum Mayr).
15.	Frons not broad
	Frons broad, sublenticular, the occipital margin acute.
	Front wings with the postmarginal and stigmal veins rather long, equal, not or scarcely shorter
	than the marginal; clypeus excised at apex; antennæ long, filiform, somewhat distant at
	base, the pedicel shorter than the first joint of the funicleStenoterys Thomson
	(type S. orbitalis Thoms.).

Front wings with the marginal and postmarginal veins very short, the latter scarcely developed, the marginal vein almost punctiform; elypeus normal; antennæ long, eylindrical, subelavate, the scape slender, the pedicel twice as long as the first joint of funicle. Tetracnemoidea Howard (type T. australicansis How.). 16. Axillæ united at the inner basal angles, or at least touching each other		
16. Axillæ united at the iuner basal angles, or at least touching each other		the marginal vein almost punctiform; clypeus normal; antennæ long, cylindrical, subclavate, the scape slender, the pedicel twice as long as the first joint of funicle.
Axillae widely separated at inner basal angles; postmarginal vein not developed. Eyes rounded; antenner inserted far anteriorly below an imaginary line drawn from the base of the eyes		112
Eyes rounded; antennæ inserted far anteriorly below an imaginary line drawn from the base of the eyes	16.	
the eyes		
Eyes pubescent. Marginal vein a little shorter than the stigual vein, the postmarginal vein at least as long as the stigmal vein; flagellum clavate; the funicle joints short, wider than long. Habrolepoidea Howard (type H. glauca How.). 18. Wings hyaline. 19. Wings fuscous, with white rays or bands. 23. Marginal vein punctiform, not longer than thick, the postmarginal vein not developed. 22. Marginal vein not punctiform. Marginal vein always longer than the stigmal vein. 20. Marginal vein always shorter than the stigmal vein. 21. Marginal vein always shorter than the stigmal vein. 22. Marginal vein always shorter than the stigmal vein not longer than the shaft of the stigmal vein, the latter short, perpendicular; axillæ just meet at their inner basal angles; pronotum very short, scarcely visible from above; mesonotum scaly punctate, or reticulate. Tetralophiellus Ashmead (type T. brevicoliis Ashm.). Marginal vein only a little longer than the stigmal vein, the postmarginal vein very short, hardly developed; axillæ meet at inner basal angles; pronotum not short, conical; mesonotum smooth; antennæ not short, subclavate. Tetralophiellus Ashmead (type T. texana How.). 21. Marginal vein fully twice as long as thick or about half the length of the stigmal vein, the postmarginal vein only slightly developed; antennæ clavate, the club ovate, 3-jointed, much stouter than the funicle, the scape more than twice as long as thick at apex; funicle joints one fourth longer than thick; pronotum very short, transverse linear; mesonotum microscopically reticulate; hypopygium very prominent, plowshare-shaped. 22. Antennæ subclavate, the pedicel hardly longer than thick at apex, but longer than the first joint of the funicle; funicle joints submoniliform; pronotum very short; mesonotum shagreened or scaly punctate. 23. Marginal vein about twice as long as thick, not longer than the stigmal, the postmarginal vein hardly so long; axillæ not quite meeting an inner basal angles; antennæ subclavate, inserted close to the		
Marginal vein a little shorter than the stigmal vein, the postmarginal vein at least as long as the stigmal vein; flagellum clavate; the funicle joints short, wider than long. Habrolepoidea Howard (type H. glauea How.). 18. Wings hyaline	17.	Eyes bare, not pubescent

2	6. Marginal vein rather long, the stigmal and postmarginal veins short.
	Wings with fuscous rays; lataral ocelli nearer to the eye margin than to the front ocellus;
	axillæ meeting at base of scutellum
	Wings hyaline; lateral ocelli not nearer to the eye margin than to the front ocellus; axillæ not
	quite meeting at base of the scutellum
27	7. Winged forms
	Wingless or subapterous forms
28	3. Front wings with the marginal vein linear, longer than the stigmal, the postmarginal vein rather short,
	hardly so long as the stigmal or clearly shorter, the stigmal vein bent so as to be nearly parallel
	with it
	Front wings with the marginal vein usually shorter, the stigmal and postmarginal veins short, or the
	stigmal vein is longer than the marginal and postmarginal veins united, or if with the marginal vein
	long or somewhat long, the stigmal and postmarginal veins are not short, the stigmal vein not bent
90	so as to be nearly parallel with the marginal
40	filiform, the joints subequal, at least three times as long as thick, with long, sparse hairs.
	Chrysopophagus Ashmead.
20	D. Marginal vein long or somewhat long, the stigmal and postmarginal veins not short
~ (Marginal vein usually shorter, the stigmal and postmarginal veins short, or the stigmal vein longer
	than the short marginal and postmarginal veins united
30	D. Frons minutely shagreened, with some minute punctures scattered over the surface
	Frons broad, smooth, margaritaceously shining, impunctate
31	1. Antennæ 11-jointed, with a 6-jointed funicle
	Antennæ 9-jointed, with a 4-jointed funicle
32	2. Antennæ not longer than the body, the joints of the flagellum closely united and clothed with a short,
	dense pubescence
	Antennæ much longer than the body, the joints of the flagellum subpedunculate and each joint fur-
	nished with two whorls of long hairs
	B. Antennæ long, filiform, 9-jointed, feebly compressedEctroma Westwood.
34	4. Marginal vein slender, not stout
	Marginal vein rather short and stout, the stigmal and postmarginal veins very short.
	Scape usually broadly dilated below, the flagellum slender, cylindrical Anagyrus Howard.
35	5. Stigmal vein long; scape long, dilated and compressed beneath, the flagellum filiform, clothed with a
	short dense pile; scutellum triangular, acute at apex; body shagreenedDinocarsis Förster.
	Stigmal vein short; scape broadly compressedly dilated beneath, the flagellum compressed, fusiform,
9.0	broadest towards the middle and gradually tapering off towards apex
30	S. Scutellum lunate
	Scutellum triangular or subtriangular, never lunate.
	Frons smooth, shining, somewhat iridescent
	Scape and flagellum normal, the latter clothed with a short, dense pile.
	Ericydnus Walker.
37	7. Scutellum bifoveate at base; scape and flagellum not at all compressed, cylindrical.
	Ectroma Westwood.
	Scutellum not fovcate at base; scape broadly dilated beneath, the flagellum compressed, fusiform.
	Anusia Förster.

38.	Frons convex, finely coriaceous; scape rather short, clavate, the pedicel twice as long as thick at tip, longer than the first funicle joint
39.	Frons not broad
	Frons broad; axillæ united at inner basal angles.
	Antennæ long, fusiform, without branches, and inserted rather high up on the face, the flagel-
	lum clothed with sparse black pile
	Antennæ with 4 branches, a branch on joints 1 to 4 of funicleTetracnemoidea Ashmead.
40.	Axillæ united or touching each other at their inner basal angles; antennæ either simple or ramose 41
	Axillæ either widely separated or at least not touching each other at their inner basal angles.
	Antennæ with 4 branches
41.	Eyes bare, not pubescent. 42
	Eyes pubescent.
	Marginal vein a little shorter than the stigmal, the postmarginal vein at least as long as the
	stigmal vein, flagellum hairy, without branches
42.	Antennæ with five long branches
	Antennæ with four long branches.
	Marginal vein not thrice as long as the stigmal vein; postmarginal vein very short or not de-
	<i>veloped</i>
	Marginal vein about thrice as long as the stigmal vein, the postmarginal vein short; pronotum
4.0	very short
43.	Marginal vein only a little longer than the stigmal; pronotum not short, conical, at least as long as
	the mesonotum
	Marginal vein only about thrice as long as thick or about half the length of the stigmal; pronotum very short
4.1	Marginal vein punctiform, not half the length of the stigmal, the postmarginal wanting.
11.	Pentacnemus Howard.
	Tribe II. Encyrtini.
	The species falling in this tribe are broad and robust, the mandibles being broad
an	d stout, truncate at apex, and edentate or nearly; the labrum is conspicuous; the
an	tennæ are very similar in both sexes; the marginal vein in the front wings is
	ort, the stigmal and postmarginal veins being usually long; in the hind wings
U116	e marginal cell is long and broad, while the hind tibiæ have two apical spurs.
	TABLE OF GENERA.
1.	Metathorax with the lateral ridge bare; spurs of hind tibiæ nearly equal
	Metathorax with the lateral ridge or at least the metapleura clothed with a silvery white pubescence;
	spurs of the hind tibiæ unequal
2.	Frons broad with a sparse, thimble-like punctuation, thicker towards the scrobes; stigmal and post-
	marginal veins long, nearly equal in length and three or more times longer than the marginal; apical
	half or more of front wings usually infumated; scape long and slender.
	Scutellum with a tuft of long hairs towards apex; first joint of the flagellum hardly so long as
	the second Encyrtus Latreille (type Chrysis infidus Rossi).
	Scutellum without a tuft of long hairs; first joint of the flagellum a little longer than the second.
	Howardiella Dalla Torre (type Bothriothorax peckhani Ashm.).

3. From not broad, nearly smooth, opaque or minutely shagreened, or with only a few minute punctures; stigmal and postmarginal veins unequal, the latter only slightly developed, the marginal vein very short, nearly punctiform; front wings hyaline but with a discoidal cloud......Prionomastix Mayr (type Encyrtus morio Dalman).

TRIBE III. Mirini.

In this tribe fall the vast majority of the genera of the subfamily *Encyrtinæ*, distinguished from the others by the mandibles, which are somewhat differently shaped, and *tridentate* at apex. The tribe was fully discussed in the Proceedings of the U. S. National Museum for 1900. The table of the genera published below is practically the same as published in that work, except that some slight changes have been made to enable me to incorporate some interesting new genera unknown at that time.

1.	Females
	Males
2.	Mandibles rather long, with acute teeth, the apical tooth usually the longest, rarely with the two apical teeth longer than the inner; labrum conspicuous; front very closely punctate, or finely coriaceous, the thimble-like punctures absent, or the punctures smaller or more sparsely scattered; wings not ornate, and usually with a very short, or a punctiform, marginal vein, the hind wings usually with a long costal cell that extends to the hooklets; abdomen usually more or less compressed towards apex, the ventral valve extending to the anus but not plowshare-shaped; head as viewed from in front usually somewhat longer than wide, often much longer than wide, or subtriangular, the scrobes forming a triangle
	Mandibles shorter, with the teeth smaller, less acute and equal or nearly; labrum not conspicuous;
	from frequently but not always with a series of large, thimble-like punctures; wings variable, fre-
	quently ornate or dusky, although often hyaline; scrobes usually semicircular
3.	Marginal vein punctiform, not or scarcely longer than thick (very rarely twice as long as thick), the
	postmarginal vein not at all or only slightly developed, very rarely as long as the stigmal vein; stigmal vein is rather long, always more than twice the length of the marginal, or much longer; body metallic or lustrous
	ginal vein longer than the stigmal vein
4.	Head viewed from in front long, subtriangular, much longer than wide, the cheeks, or malar space, long
	Head viewed from in front not or scarcely longer than wide, the cheeks, or malar space, not especially long
5.	Front wings with a marginal fringe
	Front wings without a marginal fringe.
	Antennæ very long and slender, the flagellar joints all very long, cylindical, the sixth being at least four times as long as thick, the preceding still longer
6.	Pedicel fully three times or more longer than thick at apex
	Pedicel not three times as long as thick at apex

7.	Flagellum very long, two or more times longer than the scape, the funicle joints all cylindrical 8 Flagellum not so long, at the most not more than one and a half times the length of the scape, the funicle joints gradually decreasing in length, not all the joints longer than thick, some at least wider than long
8.	Antennæ very long and slender, as in <i>Psilophrys</i> , the scape very long and slender; cheeks not quite the length of the eyes; ovipositor very longParapsilophrys Howard (type <i>P. gclechiæ</i> How.).
	Antennæ long and slender but shorter than in <i>Psilophrys</i> , about twice as long as the scape, the joints of the funicle long and cylindrical, the club not or only a little thicker than the last joint of the funicle; cheeks longLiothorax Mayr (type <i>Encyrtus glaphyra</i> Walker).
9.	Flagellum at the most about one and a half times the length of the scape, the funicle joints gradually decreasing in length, some toward the apex transversely; club much thickened; obliquely truncate from beneath; head and mesonotum finely, closely punctate or shagreened; from somewhat narrowed; eyes bareLitomastix Thomson (type Encyrtus chalconotus Dalm.).
	Flagellum short, not much longer than the scape; the funicle joints, except the first, not longer than thick; club stout, broader than the funicle; from broad; eyes faintly hairy. Berecyntus Howard (type B. bakeri Howard).
	Cheeks as long as the eyes or nearly; antennæ rather long, the funicle joints, however, rarely more than twice as long as thick, gradually thickening apically; the sixth joint never much longer than wide and sometimes wider than long
11.	Cheeks more than half the length of the eyes; pedicel hardly twice as long as thick; the flagellum not long; the joints of the funicle, except the first, small, not longer than thick, submoniliform, but gradually increasing in size
	Cheeks very short, nearly obsolete; pedicel three times as long as thick, the flagellum short, clavate, the joints of the funicle annular, wider than long, the club greatly enlarged, longer than the funicle; mesonotum short, twice as wide as long, the pronotum not visible from above; from very narrow, the lateral ocelli close to the eye margin; eyes large, rounded, pubescent. Archinus Howard (type A. occupatus How.).
12.	Mesonotum smooth, impunctate, blue or metallic; pedicel about thrice as long as thick, the flagellum long, the joints of the funicle much longer than thick, the club somewhat stouter than the funicle eyes pubescent; scutellum, but not the axillæ, shagreened
	Mesonotum feebly, sparsely punctate, metallic blue or blue-green; pedicel hardly twice as long as thick, the flagellum long and slender, joints 4–5 twice longer than thick, cylindrical, the club 3-jointed, not thicker than the funicle; eyes large, glabrous; scutellum, as well as the axiller sculptured
13.	Abdomen globose, or subovate, much shorter than the thorax, compressed, clothed with a rigid white pubescence, the second segment usually large, smooth medially; species sometimes apterous. 14 Abdomen with the dorsum flat or concave, not rigidly pubescent
14.	Pronotum not large; antennæ simple, the flagellum usually long, subclavate, but not broad nor compressed
	Pronotum large, conical, longer than the mesonotum; antennæ with the scape and the flagellum broad, strongly compressed; abdomen globose Mira Schellenberg (type M. macrocera Schell.).
15.	Head above rounded, seen from in front much longer than wide; from narrow; scape long and slender; scutellum not longer than the mesonotum, coriaceous; abdomen ovate, as long as the thorax Sphæropisthus Thomson (type S. pascuorum Thomson)

	Head seen from in front not longer than wide; frons broad; antennæ not long, inserted on a line with the base of the eyes, flagellum subclavate, the funicle joints, or at least joints 3-6, wider than long; scutellum large, longer than the mesonotum; front wings with a substigmal cloud; postmarginal and stigmal veins long, the latter nearly parallel with the costal margin; abdomen shorter than the thorax, compressed
16.	Head always distinctly leuticular, the scrobes short, the punctures frequently large, thimble-like; hind wings with the costal cell usually extending to the hooklets
17.	antennæ are inserted on the middle of the face
18.	Mesonotum with the punctuation similar to that of the head
19	Scape normal, not dilated beneath, never with a leaf-like expansion, at the most clavate
20.	Punctures on the head and thorax coarse and dense. Mesonotum very short, only half the length of the scutellum; club of antennæ as long as all the funicle joints united; postmarginal vein as long as the stigmal vein Chalcaspis Howard (type C. pergandei How.).
	Mesonotum at least as long as the scutellum; club of antennæ shorter than the funicle; post-marginal vein much shorter than the stigmal
21.	Punctures on the head and the thorax smaller and less dense; mesonotum a little longer than the scutellum; funicle joints longer than thick
	punctate
	Club of the antennæ very large, longer than the funicle and the pedicel united; postmarginal and the stigmal veins very long, the latter the shorter
22.	Vertex not very narrow, very sparsely and feebly punctate; eyes not especially large, nor nearly occupying the whole sides of the head; scrobes rather deep; scape slightly dilated beneath towards apex, the flagellum subclavate, ringed with white, the club scarcely thicker than the funicle; ocelli in an obtuse triangle, the lateral farther apart than to the front ocellus; wings hyaline, subfuliginous toward base, the marginal vein punctiform, the stigmal vein longer than the short postmarginal and the marginal united

	of funicle, as well as the following, transverse; front wings with a large discal cloud beneath the
	stigmal and marginal veins, the postmarginal and the stigmal veins very long.
	Euryrhopalus Howard (type E. schwarzi Howard).
23.	Marginal vein short, rarely much more than twice longer than thick
	Marginal vein rather long, rarely shorter than the stigmal vein
24.	Head with some sparse thimble-like or umbilicate punctures; scutellum a little longer than the
	mesonotum; eyes pubescent.
	Club of antennæ not longer than joints 1 and 2 of funicle united, the funicle joints all longer
	than wide; marginal vein scarcely as long as the stigmal vein, the postmarginal vein longer
	than the stigmal; abdomen conic-ovate, a little longer than the head and thorax united, with
	the ovipositor subexserted, dorsum subconcave; mandibles with the two outer teeth longer
	and more acute than the inner
	Club of antennæ very large and distinctly longer than the funicle, the funicle joints all very
	short, wider than long; abdomen depressed, oval, shorter than the thorax; mandibles with
	small, subequal teeth
05	
25.	Wings embrowned, the costal cell in hind wings narrow and short; mesonotum scarcely as long as the
	scutellum, finely shagreened, with sparse punctures; eyes large, bare; flagellum ringed with white
	pedicel obconical, only a little longer than thick, the following joints gradually shortening, the last
	three funicle joints being not longer than wide Phænodiscus Förster (type Encyrtus æneus Dalm.)
	Wings hyaline, the costal cell in hind wings long and narrow; mesonotum scarcely as long as the
	scutellum, finely transversely rugulose or shagreened, especially anteriorly; eyes pubescent; flagel
	lum subclavate, not ringed with white; pedicel very long, three times as long as thick, the funicle
	joints, except the first, wider than long
26.	Antennæ inserted on or a little above the middle of the face
	Antennæ inserted near the mouth border or very far below the middle of the face
27.	Frons convex, somewhat coarsely and closely punctate; scape not extending beyond the ocelli; meso
	thorax rather coarsely shagreened; front wings with the marginal, stigmal and postmarginal veins
	long, subequal
	From highly convex but smooth; scape very long, extending far beyond the ocelli; mesonotum
	smooth, polished; front wings fasciate or maculate, the marginal vein short, the postmarginal and
	stigmal veins much longer
28.	Antennæ with the funicle 6-jointed
	Antennæ with the funicle 3, 4- or 5-jointed
29.	Metathorax with the pleura and the lateral ridges always clothed with a dense, silvery-white pubes
	cence; body rather robust
	Metathorax bare, or with the lateral ridges superiorly alone pilose
30.	Antennæ similar in both sexes, the club strongly obliquely acuminate, conical, often white; from
	wings most frequently with a fuscous cloud or maculate; scape cylindrical, not at all dilated 31
	Antennæ dissimilar in the sexes, the club not thicker than the funicle; marginal and postmargina
	veins not very short, the former usually, but not always, a little the longer
31.	Marginal vein not punctiform, the stigmal and postmarginal veins rather long, at least twice longer
	than the marginal
	Marginal vein punctiform or nearly; the stigmal vein very long, curved; the postmarginal vein en
	tirely wanting
32	Thorax without a white lunula before the tegulæ; ovipositor not exserted, or if exserted very slender 35
04.	Thought a filled reliable before the together, or positor not exserted, or it exserted very stonder se

	Thorax $with$ a white lunula before the tegulæ, rarely without; ovipositor strongly exserted, thick and
	compressed, the sheaths broad; abdomen rather long, as seen from above conic-ovate.
	Cerchysius Westwood (type Encyrtus subplanus Dalm.).
33.	$ From s \ rather \ narrow, the \ eyes \ large, \ converging \ above, the \ lateral \ ocelli \ lying \ close \ to \ the \ eye \ margin; $
	abdomen oval or ovate, the ovipositor not exserted; thorax not closely or deeply punctate; hind
	wings with the costal cell short and narrowSceptrophorus Förster (type S. sceptriger Först.).
	From not narrow, the eyes smaller and only slightly converging above, the lateral ocelli not close to
	the eye border, distant; scrobes semicircular; abdomen oval-rotund, the ovipositor exserted but
	very slender; thorax short, closely punctate, or with large, deep punctures; hind wings with the
	costal cell broad and extending to the hooklets Echthroplexis Förster
	(type Cænocercus puncticollis Thoms.).
34.	Head as viewed from the side with the frons not prominent; antennæ normal or at the most with only
	the scape compressed or dilated; wings hyaline, rarely fuscous or subfuscous with whitish transverse
	or hyaline bands, the marginal vein rarely punctiform, but rarely longer than the stigmal vein, the
	postmarginal vein most frequently developed, rarely wanting or shorter than the marginal or stigmal
	veins
	Head as viewed from the side with the frons prominent, the face inflexed; antennæ frequently
	strongly compressed, dilated; front wings usually fuscous or with fuscous rays, the marginal vein
	somewhat thick, oblong, very rarely much shorter or much longer than the stigmal vein, the post-
	marginal vein usually wanting; ovipositor not or scarcely exserted
95	Marginal vein very short, punctiform, rarely longer than thick, the stigmal vein from two and one-half
əэ .	to three times longer than the marginal, the postmarginal vein wanting or short, only slightly devel-
	oped, rarely well developed; scape slender, or at most subclavate; body metallic
	Marginal vein not short, punctiform, although rarely longer than the stigmal vein, the postmarginal
	vein most frequently well developed, rarely somewhat shorter than the marginal or stigmal veins 38
26	Pedicel obconical, much stouter and longer than the first joint of the funicle, sometimes as long as
50.	joints 1 and 2 united; from rather narrow, the eyes as seen from in front somewhat convergent
	above; club of antennæ not especially large, shorter than the funicle
	Pedicel short, scarcely longer than thick; from moderate, the ocelli about their width from the eye
	margin; club of antennæ large, the length of the funicle or nearly; funicle joints short, submonili-
	form, the three or four terminal joints wider than long
0.7	(type Encyrtus ensiger How.).
37.	Lateral ocelli close to or touching the eye margin; postmarginal vein not or only slightly devel
	oped.
	Eyes bare; postmarginal vein not developed
	(type Encyrtus clisiocampæ Ashm.).
	Eyes pubescent; postmarginal vein as long as the marginalAgeniaspis Dahlbom (part).
	Lateral ocelli not close to the eye margin, from one and a half to twice their width from it; post-
	marginal vein somewhat developed Psyllæphagus Ashmead (type <i>Encyrtus pachypsydæ</i> How.).
38.	Species not metallic; head and thorax opaque or subopaque, alutaceous, or closely microscopically
	punctate, or shagreened and punctate
	Species metallic or submetallic
39.	Postmarginal vein present.
	First joint of the funicle shorter than the pedicel, all the funicle joints being short; marginal
	vein punctiform

	First joint of the funicle much longer than the pedicel, cylindrical, the following gradually shortening, but the last is still a little longer than thick
	(type H . australiensis How.).
	Postmarginal vein wanting; joints increase in width, but they are not longer than wide.
	Astymachus Howard (type A. japonica How.).
40.	Thorax without a scaly pubescence, and without white lunulæ before the tegulæ
	Thorax with a scaly pubescence, and with white lunulæ before the tegulæ.
	Scape more or less dilated beneath, especially towards the apex, rarely simple, the flagellum
	ringed with white; wings hyaline, the stigmal and postmarginal veins subequal, longer than
	the marginal Blastothrix Mayr (type Encyrtus sericeus Dalm.).
41.	Scape normal, not expanded or dilated beneath, at the most subclavate; wings hyaline
	Scape dilated or expanded beneath, the club not especially enlarged, shorter than the funicle, the
	latter usually ringed with white, the first four joints of same longer than wide; front wings usually
	with fuscous bands, or fuscous with hyaline bands or markings Microterys Thomson
	(type Encyrtus sylvius Dalm.).
42.	Thorax finely coriaceous, subopaque, without punctures scattered over the surface; from punctate;
	postmarginal vein longer than the stigmal
	Thorax smooth, impunctate, or at the most microscopically reticulate, or with fine longitudinal strice
	on the mesonotum
43.	Scape subclavate, the funicle 6-jointed, the joints wider than long, the club not thicker than the funicle; front wings hyaline with an oblique hairless line from the marginal vein; stigmal and postmarginal
	veins longer than the marginal; scutellum with a delicate median grooved line at base.
	Holcencyrtus Ashmead (type Aphycus niger Ashmead.).
11	Mesonotum smooth, impunctate, or at the most microscopically reticulate
11.	Mesonotum with fine longitudinal striæ.
	Stigmal vein scarcely longer than the marginal, the postmarginal longer than the marginal and
	the stigmal veins united; eyes pubescent; funicle joints 2-4 not longer than thick.
	Ageniaspis Dahlbom (type Encyrtus fuscicollis Dalm.).
45.	Stigmal vein very short, not or scarcely so long as the marginal and postmarginal veins united; axillæ
	either meet at their inner basal angles or they are separated
	Stigmal vein much longer than the marginal, as long or longer than the marginal and postmarginal
	veins united; the axillæ do not meet at their inner basal angle
46.	Lateral ocelli not close to the eye border; club of antennæ not much enlarged, only about half the
	length of the funicle, the joints of the funicle cylindrical, much longer than wide, never moniliform;
	abdomen conic-ovate, usually a little longer than the head and thorax united.
	Pseudencyrtus Ashmead (type Encyrtus cecidomyiæ How.).
	Lateral ocelli close to the eye border; club of antennæ not one third the length of the funicle, the
	joints of the funicle gradually thickening to the club, wide, joints 1 to 5 a little longer than thick,
	the sixth quadrate; abdomen short-ovate, shorter than the thorax.
47	Tachardiæphagus Ashmead, gen. nov. (type T. thoracicus Ashm.).
I 1.	Stigmal vein not longer than the marginal and postmarginal veins united, usually distinctly shorter than the marginal.
	Postmarginal vein longer than the stigmal.
	Club of antennæ short, not one third the length of the funicle, funicle joints 1 to 4 short-
	ening, not longer than thick; axillæ meet at base of scutellum; head sublenticular-

	with some sparse punctures, the lateral ocelli away from the eye border; abdomen
	ovate, flat above, not longer than the thorax Tachinæphagus Ashmead, gen. nov.
	Postmarginal very short, or shorter than the stigmal. (type T. zealandicus Ashm.).
	Club of the antennæ much enlarged, usually as long or nearly as long as the funicle, or
	a little longer, and obliquely truncate from beneath, the joints of the funicle, or at least
	the first three or four joints, moniliform, or not longer than thick, the others transverse;
	abdomen ovate, rarely longer than the head and thorax united, most frequently the
	length of the thorax or a little longer
	(type Encyrtus thyreodontis Ashm.).
	Club of antennæ not much enlarged, nor obliquely truncate from beneath, fusiform, and
	less than half the length of the funicle, none of the funicle joints wider than long;
	abdomen short ovate, hardly as long as the thoraxSyrphophagus Ashmead
	(type Encyrtus mesograptæ Ashm.).
	Stigmal vein very short, scarcely so long as the marginal and postmarginal veins united, the former
	being not more than, or hardly, twice as long as thick, the postmarginal vein never well developed,
	although acuminate and longer than the short marginal; club of antennæ oblong, stouter, and a
	little more than half the length of the funicle, the first two or three joints of the funicle short or
	moniliform, the following a little longer than thick, or at most with only the last two joints a little
	wider than long; abdomen broadly oval and considerably shorter than the thorax; scutellum vari-
	able, subopaquely sculptured or polished, impunctate, the axillæ not quite meeting at their inner
	basal angles
0	
:0.	Winged 49
	Apterous.
	Scutellum triangular, acute at apex, not declivous; head with the scrobes deep; antennæ simple
0	Head with the face much inflexed, the scrobes deep, semicircular, the frons most frequently regularly
υ.	or very minutely, feebly punctate
	Head always semiglobose, the face less distinctly inflexed, the scrobes, however, always forming a
	semicircle; antennæ simple, or at least never much compressed, nor very broad, subcylindrical;
	wings not fusco-radiate; scutellum with a clump of hairs at apex
	(type C. formosus Westwood
sn.	Wings fuscous, usually with the extreme tips white or hyaline
, O.	Wings not so colored.
	Wings with fuscous rays, or with leopard-like spots
	Wings hyaline or at most with a discoidal cloud; antennæ short.
	,
	Eyes large, rounded, strongly convergent above and leaving a very narrow or linear
	vertex; antennæ very short, the club enormously enlarged, longer than the funicle
	and several times thicker, the joints of the funicle transverse Zaomma Ashmead
	(type Encyrtus argentipes How.).
	Eyes not unusually large, only slightly converging above, the vertex not especially
	narrow; club of antennæ not unusually enlarged and about the length of the funicle,
	the joints of the funicle transverse, the first two or three submoniliform.
51	Adelencyrtus Ashmead (type Encyrtus chionaspidis How.).
JΙ.	Wings with leopard-like spots; antennæ very long and slender, longer than the body, the club en-
	larged Callipteroma Motschulsky (type C. 5-signatus Motsch.).

	Wings with fuscous rays.
	Head oblong; antennæ strongly compressed, broad; occipital margin and the scutellum normal.
	Cerapterocerus Westwood (type C. mirabilis Westw.).
	Head not oblong; antennæ neither strongly compressed nor broad; occipital margin medially
	and superiorly, with two strong clavate hairs; scutellum at apex with one or two clumps
	of hairs; marginal vein more than twice as long as thick.
	Funicle 6-jointed, the joints wider than long, the club not especially large.
	Habrolepis Förster (type Encyrtus dalmani Westw.).
	Funicle 4-jointed, the joints fully twice as long as thick, or a little longer, the club very.
	large, fusiform, nearly as long as the funicle and much stouter.
	Homalopoda Howard (type H. cristata How.).
52.	Marginal vein shorter than the stigmal or no longer
	Marginal vein longer than the stigmal; facial impression not bounded by a distinct arched carina
	superiorly
53.	Scutellum without a tuft of black bristles near apex
	Scutellum with a tuft of black bristles near apex.
	Head with a series of moderately large punctures; axillæ very narrow, transversely wedge-
	shaped, with the points just meeting at base of the scutellum; antennæ compressed, the
	scape wide Eusemion Dahlbom (type Encyrtus corniger Haliday).
	Head microscopically punctate; axillæ with their points not quite meeting; antennæ strongly
	clavate, subcompressed, the scape subclavate, the club very large, many times larger than
	the funicle, the joints of the latter transverse, linearBlatticida Ashmead, g. nov.
	(type B. pulchra Ashm.).
54.	Head smooth, shining, with very fine, sparse punctures; occili in an acute triangle; axillæ united at
	base of the scutellum
55.	Facial impression not bounded by an arched carina superiorly 57
	Facial impression and scrobes deep, bounded by a distinct arched carina superiorly.
	Scutellum without a tuft of bristles 56
	Scutellum with a tuft of bristles.
	Stigmal and postmarginal veins very long
	(type Rileya splendens How.).
56.	Marginal and postmarginal veins subequal, the stigmal a little the longer; eyes naked; ocelli in an
	acute triangle; funicle not longer than the first joint of the club Asteropæus Howard
	(type A. primus How.).
	Marginal longer, the stigmal and postmarginal veins not long; eyes pubescent; joints of the funicle
	all short and rapidly widening from the narrow pedicel, the club longer than the funicle, obliquely
	truncate from beneath towards apex; tarsi short and somewhat thickened Anicetus Howard
	(type A. ceylonensis How.).
57.	Scutellum normal; eyes pubescent; antennæ short, the scape somewhat broadly dilated toward apex;
	the flagellum strongly incrassated, scarcely longer than the scape, the very large club longer than
	the funicle, the joints of funicle annular; marginal vein punctiform, the stigmal and postmarginal
	veins very long as in EncyrtusZarhopalus Ashmead (type Z. sheldoni Ashm.).
58.	Antennæ 10-jointed, the funicle 5-jointed.
	Scape linear, wholly received in the scrobes; marginal vein punctiform Metallon Walker
	(type M. acacallis Walk.).

	Antennæ 9-jointed, the funicle 4-jointed Cercobelus Walker (type C. jugæus Walk.).
	Antennæ 6-jointed, the funicle 3-jointedCoccobius Ratzeburg (type unknown.)
59.	Mandibles with the teeth shorter, less acute; labrum not conspicuous; frons punctate and frequently
	with a series of large, thimble-like punctures; wings often ornate, sometimes wanting or ab-
	breviated
	Mandibles rather long, with acute teeth, the apical one usually larger and more acute than the other
	two; labrum conspicuous; frons very closely punctate or shagreened, the large punctures wanting;
	front wings not ornate, usually with a punctiform or very short marginal vein, the hind wings
	usually with a long costal cell, which extends to the hooklets; head, as seen from in front, rather
	narrow and long, subtriangular, the scrobes forming a triangle.
	Postmarginal vein wanting or hardly developed, the marginal vein very short, punctiform. 60
	Postmarginal vein distinct, longer than the stigmal vein
60.	Head, viewed from in front, much longer than wide, the cheeks long
00.	Head, viewed from in front, not longer than wide, the cheeks not long
61	Front wings with marginal cilia
01.	Front wings without marginal cilia.
	Antennæ very long and slender, the flagellar joints all very long, the sixth the shortest, but
	five times as long as wide
62	Pedicel three or more times longer than thick at apex, the flagellum with long hairs.
02.	Funicle joints about four times as long as thick, cylindrical; mesonotum and scutellum
	shagreened
	Funicle joints less than thrice as long as thick; mesonotum reticulateLiothorax Mayr.
	Pedicel not three times as long as thick, the flagellum clothed with long hairs.
	Copidosoma Ratzeburg.
00	
00.	Cheeks about half the length of the eyes; funicle joints 1-5 triangularly toothed, with long hairs.
	Prionomitus Mayr.
	Cheeks very short; eyes large, rounded, pubescent; pedicel thrice as long as thick. Archinus Howard.
C A	
04.	Mesonotum lustrous, smooth, blue or metallic.
	Pedicel about thrice as long as thick, the flagellum filiform or subfiliform, with a short, sparse
	pubescence, the funicle joint from two and a half to three times as long as thick; the first joint very long, four or more times longer than thick; eyes pubescent; postmarginal vein
	very long
	very long ratency rus Ashmead.
or	
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent. 66 Abdomen subglobose or subovate, clothed with a rigid white pubescence. Pronotum large, conical; antennæ strongly compressed, broad; wings wanting or poorly deoped, not extending to middle of abdomen. Mira Schellenberg.
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent. 66 Abdomen subglobose or subovate, clothed with a rigid white pubescence. Pronotum large, conical; antennæ strongly compressed, broad; wings wanting or poorly deoped, not extending to middle of abdomen. Mira Schellenberg. Pronotum not large; antennæ simple, neither compressed nor broad.
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent
65.	Abdomen with the dorsum flat or concave, not rigidly pubescent
	Abdomen with the dorsum flat or concave, not rigidly pubescent
	Abdomen with the dorsum flat or concave, not rigidly pubescent

	Head transversely broad, always lenticular, the scrobes short, the punctures large, thimble-like; hind wings with the costal cell usually extending to the hooklets.
	Marginal vein rarely short, at least longer than thick, and usually much longer; mesonotum
	smooth, impunctate, or at most shagreened
	Marginal vein very short, punctiform, not or scarcely longer than thick; mesonotum punctate.
	Mesonotum with the punctuation unlike that of the head, the punctures less dense and
	the surface finely coriaceous; postmarginal and stigmal veins short, subequal 67
	Mesonotum with the punctuation similar to that of the head; postmarginal vein very short
	or subobsolete (rarely long), the stigmal vein long.
	Scape normal, without a leaf-like expansion beneath.
	Punctures on head and thorax coarse and dense.
	Mesonotum very short, only about half the length of the scutellum; post-
	marginal vein usually as long as the stigmal; flagellum long, with long
	sparse hairs, not arranged in half whorls
	Mesonotum at least as long as the scutellum or very nearly; postmarginal
	vein much shorter than the stigmal; flagellum with funicle joints sub-
	excised at apex, with half whorls of long hairs.
	Bothriothorax Ratzeburg.
	Punctures on head and thorax small and less dense; mesonotum a little
	longer than the scutellum
67.	Vertex and face broad, finely shagreened, and sparsely punctate; scrobes deep, semicircular.
	Pedicel obconical, longer than thick at apex, the flagellum subclavate, the joints, after the first,
	wider than long
	Pedicel very minute, the flagellum filiform, pilose, the joints subequate, about two and one half
	times as long as thick
	Vertex and face very narrow, or not broad.
	Head with coarse thimble-like punctures, the thorax smooth, impunctate; flagellum short,
	thick, filiform, clothed with a dense short pubescence, the joints wider than long.
	Ænasius Walker.
	Head smooth without coarse thimble-like punctures, at the most with some sparse punctures
	on the vertex; flagellum long, subclavate, not thick and only sparsely pubescent. Euryrhopalus Howard.
68	Marginal vein rather long, rarely shorter than the stigmal
00.	
	Marginal vein rarely more than twice as long as thick; head with rather sparse, scattered, umbilicate punctures, the scutellum a little longer than the mesonotum.
	Head not wider than the thorax between the wings; flagellum not short, filiform, and clothed with rather short sparse hairs, the funicle joints longer than wide, the first a little the longest.
	Hemencyrtus Ashmead.
	Head wider than the thorax between the wings; flagellum short, strongly clavate, as in the
	female; the club large and longer than the funicle, the joints of the latter minute, annular.
	Coccophoctonus Ashmead.
69.	Mesonotum as long as the scutellum or nearly, rarely somewhat shorter, the surface finely shagreened,
•••	at most with some feebly defined sparse punctures; marginal vein shorter than the stigmal, the lat-
	ter not very short; flagellum filiform, pilose, the funicle joints about twice as long as thick; eyes
	bare
	Zanorii, Tanonousous Poistei.

	Mesonotum much shorter than the scutellum, finely delicately shagreened or rugulose, especially anteriorly; marginal vein a little longer than the stigmal; flagellum subclavate, densely pubescent, the funicle joints 2-6 not longer than thick, if anything a little wider than long; eyes pubescent.
	Rhytidothorax Ashmead.
70.	Antennæ inserted near the mouth border or far below the middle of the face
	Antennæ inserted on or a little above the middle of the face.
	From subconvex, somewhat coarsely and closely punctate; thorax rather coarsely shagreened
	or finely rugulose; scape not extending beyond ocelli; front wings with the marginal, post-
	marginal and stigmal veins long, subequal
	From highly convex, smooth and polished, as is also the thorax; scape long, extending far
	beyond the ocelli; front wings with the marginal, postmarginal and stigmal veins rather
	short, the marginal thickened with a fuscous cloud or band beneath; flagellum with six long
71	branches
71.	Antennæ with the funicle 2-, 3-, 4- or 5-jointed
	Metathorax bare, or with the lateral ridges superiorly alone pilose
	Metathorax with the pleura and the lateral ridges always clothed with a dense silvery pubes-
	cence; body rather robust
72.	Antennæ unlike those of the female, filiform, pilose, or with whorls of hairs, or the funicle joints den-
	tate or subpedunculate, with whorls or fascicles of hairs
	Antennæ similar to those of the female, filiform or at most subclavate, the club conical, strongly
	obliquely truncate from beneath, often white, the scape cylindrical, not at all dilated; front wings
	usually with a discoidal fuscous cloud or macula.
	Marginal vein not punctiform, although short, the stigmal and postmarginal veins long, very
	much longer than the marginal
	Marginal vein punctiform, the stigmal vein long, the postmarginal vein not developed or
	wanting Isodromus Howard.
73.	Marginal and postmarginal veins not very short, the former usually a little longer than the stigmal,
	rarely somewhat shorter.
	Thorax without white lunulæ before the tegulæ
7.4	Thorax, with white lunulæ, or at least a dot, before the tegulæ Cerchysius Westwood.
74.	Hind wings, with the costal cell short and narrow.
	Antennæ long; the flagellum long, eylindrical, clothed with long, sparse hairs; the funicle joints long
	Hind wings with the costal cell broad and extending as far as the hooklets Echthroplexis Förster.
75	Head with the frons prominent, the face inflexed; antennæ frequently compressed, dilated, broad;
10.	front wings usually with fuscous rays or fuscous with white tips, more rarely hyaline; sometimes
	apterous or subapterous; marginal vein usually somewhat thickened, oblong, very rarely much longer
	or much shorter than the stigmal, the postmarginal frequently wanting
	Head, as seen from the side, with the frons not prominent; wings most frequently hyaline, although
	sometimes with transverse fuscous bands or fuscous with white bands.
	Marginal vein not short, punctiform, but rarely longer than the stigmal, always more than
	twice longer than thick, the postmarginal most frequently well developed, rarely somewhat
	shorter than the marginal
	Marginal vein very short, punctiform, rarely longer than thick, the stigmal from two and a half
	to three times or more longer than the marginal; the postmarginal wanting or very short,
	:

	`not well developed, scape slender or at most subclavate, never dilated; from usually rather narrow, the eyes, as seen from in front, slightly converging above.
	Scape slender, or at most subclavate; from rather narrow
	Scape and flagellum abnormally compressed and broad, the funicle joints 1 to 4 wider
	than long
76	Flagellum with the hairs on the funicle joints not arranged in half whorls.
70.	
	Lateral ocelli touching the eye margin; flagellum with long hairs.
	Eyes bare; postmarginal vein not developed or so slightly developed as not to be con-
	sidered. Oöencyrtus Ashmead.
	Eyes pubescent; postmarginal vein as long as the marginal Ageniaspis Dahlbom (part).
	Lateral ocelli not close to the eye margin; postmarginal vein somewhat developed; flagellum
	filiform, with a short pubescence
	Flagellum with the hairs on the funicle joints arranged in half whorlsCoccidencyrtus Ashmead.
77.	Species metallic or submetallic
	Species not metallic; head and thorax opaque or subopaque, alutaceous, closely microscopically punctate or shagreened, and pubescent.
	Postmarginal vein present.
	Pedical longer than the first joint of funicle; flagellum clothed with hairs, the funicle
	joints, except the first two or three joints, not or scarcely longer than thick.
	Aphycus Mayr.
	Pedicel very short; flagellum elongate, the club only slightly enlarged, the funicle joints
	elongate, cylindrical, and clothed with sparse, long hairs Heterarthrellus Howard.
	Postmarginal vein wanting.
	Pedicel as long as the first funicle joint; flagellum subclavate, the club not quite so long
	as funicle joints 4-6 united, first joint of funicle the longest, the following gradually
	shortening, clothed with a short, rather dense pubescenceAstymachus Howard.
78.	Thorax without a scaly pubescence, and without white lunulæ before the tegulæ
	Thorax with a scaly pubescence, and with white lunulæ before the tegulæ.
	Flagellum elongate, the funicle joints long, excised or subexcised at apex with whorls of long
	hairsBlastothrix Mayr.
79.	Scape normal, not expanded or dilated beneath, at the most subclavate; wings hyaline
	Scape usually dilated or expanded beneath, or at least with a carina, rarely simple, unlike the female;
	wings fuscous or subfuscous, with transverse hyaline bands, rarely hyaline.
	Thorax smooth but microscopically coriaceous, with sparse punctures scattered over the surface;
	from with a series of punctures, especially on the orbits
80.	Thorax finely coriaceous, subopaque, without punctures scattered over the surface; from punctate;
	scutellum with a delicate impressed median line; wings pubescent, with an oblique hairless line
	from base of stigmal vein; flagellum subfiliform, clothed with a short, dense pubescence, the funicle
	joints a little wider than long
	Thorax smooth, impunctate, or at the most microscopically reticulate, or with fine longitudinal strice
	on the mesonotum.
	Mesonotum smooth, impunctate, or at the most microscopically reticulate
	Mesonotum with fine longitudinal striæ.
	Stigmal vein scarcely longer than the marginal, the postmarginal vein longer than the
	marginal and stigmal veins united; eyes pubescent
	, , , , , , , , , , , , , , , , , , , ,

81.	. Stigmal vein very short, not or scarcely so long as the marginal and postmarginal veins united; axillæ
	meet at their inner basal angles
	Stigmal vein much longer than the marginal, as long or longer than the marginal and postmaginal
	veins united; axillæ do not quite meet at their inner basal angles.
	Antennæ with the scape rather short and stout, not reaching to the front ocelli, the flagellum
	elongate filiform, clothed with sparse moderately long hairs, the funicle joints about thrice as
	long as thick, or nearly
	Antennæ with the scape long, slender, reaching to or beyond the front ocellus, the flagellum elon-
	gate filiform, the funicle joints more than twice longer than wide, with long sparse hairs; scutel-
	lum shagreened or striate
82.	Stigmal vein not longer than the marginal and postmarginal veins united, usually distinctly shorter,
	the postmarginal very short, or shorter than the stigmal
	Antennæ with the scape short, not extending beyond the middle of the face, the flagellum fili-
	form, sparsely pilose, the funicle joints about two and a half times as long as thick; lateral
	ocelli about or nearly twice their width from the eye margin Syrphophagus Ashmead.
	Stigmal vein very short, not so long as the marginal and postmaginal united, the former being not more
	than or hardly twice as long as thick, the postmarginal never well developed, although acuminate
	and longer than the short marginal.
	Flagellum filiform, pilose, the joints of funicle about twice as long as thick; lateral ocelli
	at least their width from eye margin
83	Scutellum neither triangular nor acute at apex
00.	Scutellum triangular, acute at apex.
84	Antennæ simple, subfiliform, pubescent
0 2.	Funicle 2-jointed, the club unusually long and cylindrical (teste Mayr)
85	Head with vertex antero-posteriorly broad, the face much inflexed, the frons regularly punctate; an-
00.	tennæ with the scape and flagellum usually strongly compressed, broad; wings fuscous or with fus-
	cous rays
	Head always semiglobose, the face less distinctly inflexed, the scrobes always forming a semicircle;
	antennæ simple, filiform, the joints long, cylindrical, distinctly separated and hairy, rarely slightly
	compressed; wings usually fusco-radiate or partly fuscous, rarely entirely hyaline.
	Scape elongate, extending to or beyond the front ocellus, the flagellum very long, clothed
	with rather long hairs
86.	Wings fuscous, with narrow white tips
00.	Wings hyaline, the marginal vein rather long, stout, as long as the stigmal vein, the latter not short,
	the postmarginal not developed; antennæ long, filiform, the flagellum with sparse moderately long
	hairs; funicle joints 1-6 constricted at apex or subpedunculate, somewhat similar to the male in
	Eurytoma
87	Marginal vein shorter than the stigmal.
01.	Marginal vein longer than the stigmal.
	Facial impression not bounded by a distinct carina superiorly Eusemion Dahlbom.
22	Facial impression and scrobes deep, bounded by a high carina superiorly.
00.	
	Scutellum with a tuft of bristles; stigmal and postmarginal veins very long. Chrysoplatycerus Ashmead.
	Scutellum without a tuft of bristles; stigmal and postmarginal veins not long. Anicetus Howard.
	Facial impression not bounded by a carina superiorly Zarhopalus Ashmead.

89. Antennæ 10-jointed, with a 5-jointed funicle	Metallon Walker.
Antennæ 9 jointed, the funicle 4-jointed	Corcobelus Walker.
Antennæ 6-jointed, the funicle 3-jointed	
Antennæ 5-jointed, the funicle 2-jointed, the club unusually	long and cylindricalHabrolepis Förster.

Tribe IV. Arrhenophagini.

In this tribe the mandibles are acutely pointed, or conical, and edentate; tarsi 4 or 5-jointed, while the marginal vein, in the front wings, is wanting or punctiform, the postmarginal vein being absent. The stigmal vein is sometimes present.

TABLE OF GENERA.

Front wings with the marginal vein punctiform, the postmarginal wanting, the stigmal vein rather short and curved; φ with 10-jointed antennæ, the funicle 5-jointed, joints 1-3 small, wider than long; ovipositor exserted.......Rhopoideus Howard (type R. citrinus How.).

2. Front wings with the marginal and stigmal veins wanting, the subcostal vein not quite attaining the costal edge and ending in a stigma; ♀ with 3-jointed antennæ, ♂ with 9-jointed antennæ.

Arrhenophagus Aurivillius (type A. chionaspidis Auriv.).

SUBFAMILY III. SIGNIPHORINÆ.

1894. Signiphorinæ, Subfamily, Howard, Ins. Life, VI., p. 234.

1897. Signiphorinæ, Subfamily III., Ashmead, Proc. Ent. Soc. Washington, IV., p. 248.

This subfamily was established by Dr. L. O. Howard, in 1894, and was based upon my genus Signiphora, described in 1880, from specimens bred in Florida from the purple scale, Aspidiotus citricola Packard. Many species have since been discovered from different parts of the world, and the group, although at present represented by a single genus, has evidently a wide distribution. The species destroy scale insects, Coccida, and the mealy-winged flies, Aleurodida.

Antennæ apparently 3-jointed but in reality 6-jointed, there being 3 minute ring-joints easily overlooked; wings with a long marginal fringe, the marginal vein long, about the length of the subcostal vein, the stigmal vein distinct but not long, the postmarginal vein absent; middle tibiæ with a large, lobed apical spur, and with lateral spurs or strong bristles.

Signiphora Ashmead (type S. flavopalliata Ashm.).

FAMILY LXIX. PTEROMALIDÆ.

- 1835. Pteromalidæ, Family (partim), Walker, Ent. Mag., II., p. 286.
- 1840. Pteromalides, Subfamily 3 (partim), Westwood, Intro. Mod. Class. Insect, II., p. 166; Synop., p. 67.
- 1846. Spalangiidæ, Family 7 (partim), Walker, List. Chalc. Brit. Museum, I., p. 23.
- 1846. Pteromalidæ, Family 8 (partim), Walker, opus cit., p. 23.

- 1856. Ormoceroidæ, Family XV. (partim), Förster, Hym. Stud., II., p. 59.
- 1856. Pteromaloidæ, Familie 16 (partim), Förster, opus cit., pp. 19, 25 and 63.
- 1875. Pteromalina Tribus (partim), Thomson, Hym. Skand., IV., pp. 12 and 217.
- 1886. Pteromaline, Subfamily (partim), Howard, Ent. Amer., I., p. 198.
- 1897. Pteromalidæ, Family LXIX., Ashmead, Proc. Ent. Soc. Washington, IV., p. 246.

This is the largest and most difficult family to classify of all of the families of the superfamily Chalcidoidea. It comes nearest to the family *Miscogasteridæ*, and is separated from it by a single character — the tibial spurs of the hind legs. In this family the hind tibiæ have *one* apical spur, in the *Miscogasteridæ two*.

Six subfamilies have been recognized, and these are again divided into tribes. The subfamilies may be recognized by the aid of the following table:

TABLE OF SUBFAMILIES.

	TABLE OF SUBPARITIES.
1.	Abdomen sessile or subsessile
	Abdomen distinctly petiolate
2.	Metanotum without spiracular sulci and usually without lateral folds
	${\it Metanotum\ with\ spiracular\ sulci,\ always\ present,\ the\ lateral\ folds\ also\ present\ although\ sometimes\ incomments and the spiracular\ sulci,\ always\ present,\ the\ lateral\ folds\ also\ present\ although\ sometimes\ incomments and the spiracular\ sulci,\ always\ present,\ the\ lateral\ folds\ also\ present\ although\ sometimes\ incomments and the spiracular\ sulci,\ always\ present,\ the\ lateral\ folds\ also\ present\ although\ sometimes\ incomments and\ spiracular\ sulci,\ always\ present\ although\ sometimes\ incomments and\ spiracular\ sulci,\ always\ present\ although\ sometimes\ incomments\ although\ sometimes\ incomments\ although\ sometimes\ although$
	plete, the median carina usually more or less distinct, rarely absent; antennæ 12 to 13-jointed.
	Subfamily I. Pteromalinæ.
3.	Head normal, not especially wide; antennæ 12 to 13-jointed; scutellum of normal size; hind angles of
	metanotum roundedSubfamily II. MERISINÆ.
	Head very wide, much wider than the thorax, lenticular; antennæ 6 to 10-jointed, inserted near the
	mouth border; scutellum large; hind angles of metanotum acuteSubfamily III. Eunotinæ.
4.	Front wings with the marginal vein very long, the costal cell very narrow; head transverse, convex
	anteriorly6
	Front wings with the marginal vein not especially long, often short and thick, the costal cell rarely nar-
	row; if very narrow the head is oblong; apterons forms not uncommon
5.	Head viewed from in front short or rounded, the occipital line incomplete; antennæ 9 to 13-jointed.
	Subfamily IV. Sphegigasterinæ.
	Head viewed from in front oblong, the occipital line complete; antennæ 8 to 12-jointed.
	Subfamily V. Spalangiinæ.
6.	Mesonotum rather long; head in front convex; antennæ 13-jointed, the scape long, reaching beyond
	the ocelli

Subfamily I. Pteromalinæ.

- 1897. Pteromalinæ, Subfamily II., Ashmead, Proc. Ent. Soc. Washington, IV., p. 236.
- 1900. Pteromalinæ, Subfamily II., Ashmead, Proc. U. S. Nat. Museum, XXIII., p. 248.

The sessile, not distinctly petiolate, abdomen separates this group from the Sphegigasterinæ, Spalangiinæ and the Diparinæ, while the shape of the head, scutellum, metathorax and the greater number of joints in the antennæ readily separate it from the *Eunotinæ*.

Large subfamilies, I think, should be separated into tribes, in order to facilitate quicker the recognition of genera and to show better their affinities.

I have, therefore, recognized four tribes, based upon the number of teeth in the mandibles.

TABLE OF TRIBES.

1. Both mandibles not 3-deutate	. 2
Both mandibles 3-dentate	ini.
2. Left mandible 3-dentate, the right 4-dentate.	
Antennæ inserted on or near the middle of the face, always above an imaginary line dra	awn
from the base of the eyes	lini.
Antennæ inserted far below the middle of the face, on or below an imaginary line drawn f	rom
the base of the eyes	lini.
Both mandibles 4-dentate	lini.

Tribe I. Metaponini.

The three dentate mandibles distinguish the tribe. All of the species, so far as the records go, with a single exception, are parasites of coleopterous larvæ.

	TABLE OF GENERA.
1.	Females 2
	Males
2.	Head triangular, narrowed towards the mouth, eyes large, rounded, convex; presternum large, mesosternal furrow distinct; metathoracic spiracles rounded, remote from the postscutellum 3
	Head not triangular, viewed from in front, more rounded, very slightly wider than long; eyes ob-
	long-oval or oval; presternum not large; mesosternal furrow not distinct; vertex broad; meta-
	thoracic spiracles not rounded
3.	Vertex not acute medially 4
	Vertex broad, acute medially, the frons impressed.
	Abdomen conically pointed Etroxys Westwood (E. scenicus Westw.).
4.	First joint of funicle large, fully twice as long as thick.
	Holcæus Thomson (type Etroxys dichrous Dalm.).
	First joint of funicle small, not or hardly 1½ times as long as thick.
	Cricellius Thomson (type C. decipiens Thoms.).
5.	Club of antennæ not white 6
	Club of antennæ white or yellowish.
	Metathorax short, with a small subglobose neck, punctate, the spiracles small, rounded; head
	transverse, wider than the thorax; antennæ inserted near the middle of the face, the flagel-
	lum subfiliform, the first joint of the funicle the largest.
	Chrysoglyphe Ashmead (type C. apicalis Ashm.).
6.	Antennæ much thickened toward apex, clavate
	Antennæ not much thickened toward apex, filiform or at most subclavate

7.	Hind coxe not small, the posterior margin at base hairy; abdomen not rotund
	Hind coxe small, subovate, the posterior margin at base not hairy; abdomen rotund; head large,
	wider than the thorax
8	Antennæ with three ring-joints
0.	Antennæ with two ring-joints.
	Collar not distinctly separated; flagellum filiform, the pedicel obconical, shorter than the first
	joint of the funicle; metathorax not short, punctate, with a median carina, the spiracles oval;
	abdomen elongate, longer than the thorax Stinoplus Thomson (type E. militaris Thoms.).
	Collar narrowed medially; flagellum filiform, the pedicel small, a little longer than thick; meta-
	thorax without a median carina, the spiracle oval; abdomen elongate, pointed toward apex,
	and longer than the head and thoraxSpintherus Thomson (type S. obscurus Thoms.).
9.	Pronotum as wide as the mesonotum, distinctly separated, and with the anterior margin acute; meta-
	thorax short, punctate, with a small globose neck and without a median or transverse carina, the
	spiracles subreniform; flagellum subfiliform, hardly thickened towards apex; abdomen ovate,
	hardly longer than the thorax; marginal vein not longer than the stigmal vein.
	Bruchobius Ashmead, g. nov. (type B. laticeps Ashm.).
	Pronotum narrower than the mesonotum, the anterior margin not acute; metathorax with a subglo-
	bose neck, punctate, and with usually median and transverse carinæ or at least with one or the
	other present, the spiracles oval or ellipsoidal, not reniform; flagellum filiform or subfiliform.
	Metanotum with a transverse carina near the base, the median carina wholly absent; mar-
	ginal vein long, a little more than twice the length of the stigmal vein.
	Lophocomodia Ashmead (type L. americana Ashm.).
	Metanotum with transverse and median carinæ present; marginal vein not long, not or hardly
	longer than the stigmal vein
	= Eupsilocera Westwood $= Dichalysis$ Förster (type P . obscura Walk.).
10.	Flagellum with three ring-joints; scutellum normal; metathorax with the median and transverse car-
	inæ usually present although sometimes the transverse fold is vaguely defined or absent, the spiracle
	oval; abdomen subcompressed beneath toward apex, the hypopygium prominent.
	Metapon Walker (type M. atrum Walker).
	Flagellum with two ring-joints; scutellum hardly elevated and produced into a blunt conical spine
	posteriorly; metathorax with median and transverse carinæ present, the spiracles large, elongate
	oval; abdomen compressed, the hypopygium prominent, plowshare-shaped.
	Acanthometapon Ashmead, g. nov. (type A. clavicornis Ashm.).
11	
11.	Head triangular, narrowed towards the mouth; eyes large, rounded, or oblong-oval, convex; prester-
	num large; mesosternal furrows distinct; metathoracic spiracles rounded, remote from the post-
	scutellum
	Head not triangular, viewed from in front more rounded, usually very slightly wider than long; eyes
	oblong-oval or oval; presternum not large; mesosternal furrow not distinct; vertex broad; meta-
	thoracic spiracles not rounded
12.	Vertex not acute medially
	Vertex broad, acute medially; antennæ long, the flagellum filiform, the funicle joints long.
	Etroxys Westwood.
13.	Antennæ subclavate; metathoracie spiracles small, round
	Antennæ filiform; metathoracic spiracles oval, or not round
14.	Tip of antennæ not white
	Tip of antennæ white

ASHMEAD. CLASSIFICATION OF THE CHALCID FLIES 313
15. Hind coxe not small, the hind margin towards base hairy
Hind coxe small, the hind margin not hairy
16. Antennæ with two ring-joints
Antennæ with three ring-joints
17. Scutellum posteriorly highly elevated and produced into a spineAcanthometapon Ashmead.
Scutellum normal, not spined.
Collar not distinctly separated
Collar narrowed medially
18. Pronotum not broad, narrower than the mesonotum
Pronotum broad, as wide as the mesonotum
19. Flagellum filiform, the joints cylindrical, those of the funicle very briefly pedicellate, hairy but not verticillate
Flagellum filiform, the joints of the funicle nodose-verticillate.
Metanotum without a median carina; marginal vein more than twice the length of the stigmal
vein
Metanotum with a median carina; marginal vein not or only a little longer than the stigmal
vein
20. Metathorax with the median and transverse carinæ usually present, the spiracles oval.
Metapon Walker.
Tribe II. Rhaphitelini.
In this tribe the left mandible is 3-dentate, the right 4-dentate, as in the tribe <i>Eutelini</i> , from which it is, however, easily distinguished by the insertion of the antennæ; these are inserted on or near the middle of the face, and <i>not</i> low down, near the mouth border, as in the <i>Eutelini</i> .
TABLE OF GENERA.
1. Females
Males
2. Front femora considerably swollen
Front femora normal.
3. Metathorax with a median carina and with the lateral folds complete, rarely abbreviated, the spiracles small, rounded or broadly oval, and lying close to the postscutellar fold.
Marginal vein in front wings thickened 4
Marginal vein in front wings normal, slender 7
4. Antennæ with ring-joints small, transverse or annular 5
Antennæ with the ring-joints large, not transverse.
Front coxæ cylindrical; knob of stigmal club obsolete
(type Cleonymus flavipes Först.).
5. Metanotum with folds and a median carina
Stigmal and postmarginal veins short; abdomen conic-ovate, keeled beneath; last joint of an-
tennæ normal
6. Stigmal vein longer than the marginal; last joint of the antennæ stylate; abdomen ovate, depressed, not keeled beneath

7.	Stigmal club, or knob, small; front margin of pronotum rounded; metanotum with a median carina,
	the lateral folds usually wanting or incomplete
	Stigmal club very large; front margin of pronotum sharp; metanotum with the lateral folds usually complete
8.	Marginal vein at least thrice as long as the stigmal vein; clypeus anteriorly bidentate; metathorax impunetate, with a median carina
9.	Clypeus at apex unarmed, either truncate, sinuate or incised
	Clypeus at apex armed with a median tooth. Thorax long, the pronotum with the front margin acute, laterally dilated, the metathorax with
	short folds Stenomalus Thomson (type S. crassicornis Thoms.).
10.	Stigmal vein ending in a small or median sized knob or club
	Stigmal vein ending in a large knob or club.
	Metathorax short and usually with a transverse carina; clypeus incised at apex medially;
	mesepisternum extending to the coxeCecidostiba Thomson (type C. rugifrons Thoms.).
	Metathorax not short, usually with a fold and often also with a transverse carina; head and
11	thorax usually with rigid pubescence Cænacis Thomson (type C. grandiclava Thoms.). First joint of the flagellum always longer than the pedicel, or of an equal length
11.	First joint of the flagellum always shorter than the pedicel
12.	Pronotum broad, the upper front margin rounded; scutellum with a cross-furrow before apex;
	abdomen conic-ovate, the second segment usually the largest, the third very short, segments 4-7
	more than twice longer than the third, subequal, or very slightly increasing in length; marginal vein
	usually a little thicker at base than at apex Habrocytus Thomson (type Pteronalus albipennis Walk.).
13.	Pedicel as long as the ring-joints and the first two joints of the funicle united; metathorax produced
	into a subglobose neck, the lateral folds distinct, the spiracles large, subreniform; abdomen ovate.
1.1	Mormoniella Ashmead, g. nov. (type M. brevicornis Ashm.). Front femora considerably swollen.
14.	Front femora considerably swotien. 20
15.	Marginal vein in front wings thickened
	Marginal vein in front wings slender
16.	Antennæ with the ring-joints small, annular
	Antennæ with the ring-joints large, not annular
17.	Metanotum smooth, without folds; stigmal and postmarginal veins short Metacolus Förster.
	Metanotum with folds and a median carina; stigmal vein longer than the marginal.
18	Rhaphiteles Walker. Stigmal club or knob small. 19
10.	Stigmal club very large; front margin of pronotum acute
19.	Marginal vein very long; clypens anteriorly bidentate
	Clypeus at apex unarmed, truncate, sinuate or incised
	Clypeus at apex armed with a median tooth
21.	Stigmal vein ending in a large knob
	Stigmal vein ending in a small or moderate sized club
22.	Clypeus at apex incised medially; metathorax short and usually with a transverse carina.
	Clypeus not incised; metathorax not short, usually with a fold and often also with a transverse carina;
	head and thorax usually with rigid bristles

Platymesopus Westwood.

TRIBE III. Eutelini.

In its mandibular characters this tribe agrees with the *Rhaphitelini*, and is easily confused with the latter; but the antennæ are inserted differently, always low down on the face, usually close to the clypeus, on or below an imaginary line drawn from the base of the eyes.

The species falling in this group differ also in habits since they attack dipterous gall-makers, *Cecidomycida*, etc.

	TABLE OF GENERA.
1.	Females
	Males
2.	Metathorax with distinct lateral folds
	Metathorax without lateral folds.
	Marginal vein not or only a little longer than the stigmal vein; metathorax long; first joint of
	the flagellum short.
	Antennæ inserted on an imaginary line drawn from the base of the eyes; abdomen not
	compressed, the ventral valve normal. Amblymerus Walker (type A. dubius Walk.).
	Antennæ inserted just above the clypeus, below such an imaginary line; abdomen com-
9	pressed, the ventral valve prominentPsilonotus Walker (type P. adamas Walk.).
٥.	Thorax short; head with a rather narrow vertex, the occili arranged in a very short obtuse angle. 4
	Thorax long; head with a broad vertex; ocelli large, in a triangle; pronotum with the front margin acute
4.	Marginal vein about twice as long as the stigmal veinEutelus Walker (type E. vulgaris Walk.).
	Marginal vein not nearly twice as long as the stigmal vein.
	Platymesopus Westwood (type P. tibialis Westw.).
5.	Abdomen ovate, shorter than the thorax
	Abdomen long, conically produced, triangularly compressed or carinate beneath.
	Marginal vein hardly twice as long as the stigmal vein.
	Platyterma Walker (type P. nobile Walk.).
	Marginal vein nearly thrice as long as the stigmal vein.
	Mesopolobus Westwood (type M. fasciiventris Westw.).
6.	Marginal vein hardly longer than the stigmal vein; antennæ rather short, the flagellum subclavate,
	the pedicel long, obconical, the funicle joints wider than long; metathorax not short, with a me-
	dian carina, the spiracles oval
7.	Thorax short; head with rather a narrow vertex; ocelli arranged in a very obtuse angle
	Thorax long; head with a broad vertex; ocelli large, arranged in a triangle
8.	Marginal vein about twice as long as the stigmal vein; middle tibiæ normalEutelus Walker.
	Marginal vein not nearly twice as long as the stigmal vein; middle tibiæ broadly dilated.

9. Marginal vein short, hardly longer than the stigmal vein
Platyterma Walker. Marginal vein nearly thrice as long as the stigmal vein; middle tibiæ with a small hirsute lobe outwardly near the tip
Tribe IV. Pteromalini.
To this tribe belong all species having both mandibles 4-dentate. It is a large tribe, with many genera and species, and some are of world-wide distribution. Pteromalus puparum L. is the commonest and best known of all Chalcidoids, and is found in every hemisphere; it attacks various lepidopterous insects, Pieris rapæ, the cabbage butterfly, being especially subject to its attacks.
TABLE OF GENERA.
1. Females
Males
2. Occipital foraminal depression immargined
Occipital foraminal depression margined or rimmed. Metathorax produced into a subglobose neck at apex, the median carina and lateral folds
usually present.
Antennæ with 3 ring-joints
Antennæ with 2 ring-joints 4
3. Abdomen with the second segment large, the last segment produced into a long, slender, compressed stylus resembling an ovipositor.
Metathorax produced into a subglobose neck, punctate and tricarinate, the spiracles small, ob-
long; metopleural ridge fringed with white hairs.
Belonura Ashmead (type B. singularis Ashm.). 4. Eyes hairy; antennæ clavate, incrassate
Eyes bare; antennæ filiform or subclavate.
5. Abdomen ovate or rotund, the second segment small or never occupying more than half the whole surface
Abdomen ovate, the second segment very large, occupying most of the surface, the third very small
6. Abdomen ovate, the second segment occupying at most not more than half the surface, the third not small, two or more times longer than the fourth; tibiæ with rigid bristles; wings sometimes maculate, the postmarginal vein always longer than the stigmal.
Urolepis Walker = Halizoa Förster (type Ormocerus maritimus Walk.).
Abdomen rotund; wings immaculate, the postmarginal vein not longer than the stigmal, usually somewhat shorter
7. Abdomen ovate, the second segment occupying not more than one third the surface, the sides more or less fimbriate; funicle joints 4-6 a little wider than long, the club subulate.
Trichomalus Thomson (type T. punctinucha Thoms.).

8. Metathorax produced at apex into a subglobose neck; postmarginal vein always longer than the

	stigmal
	Metathorax not produced into a subglobose neck at apex, rarely with a small neck; postmarginal
	vein very rarely longer than the stigmal, most frequently shorter, or of an equal length 21
9.	Pedicel always distinctly longer than the first funicle joint, more rarely of an equal length; the first
	joint of funicle usually the shortest of the funicle joints; metathoracic spiracles small, round, oval,
	long oval or elliptical
	Pedicel usually shorter than the first joint of the funicle, never longer; the first joint of the funicle
	usually the longest of the funicle joints; metathoracic spiracles large, oblong-oval or elliptical. 18
10.	Antennæ with two ring-joints
	Antennæ with three ring-joints
11.	Metathoracic spiracles oblong-oval, the lateral folds and the median carina present
	Metathoracic spiracles not oblong-oval
12.	Abdomen conic-ovate, the third and fourth segments subequal, united as long as the second, the fifth
	hardly as long as the fourth or sixth; flagellum subclavate, the joints of the funicle gradually de-
	creasing in length, not transverse; head wide, the temples oblique but rather broad.
	Polyscelis Dalla Torre (type Pteromalus conspersus Walk.).
	Abdomen ovate, pointed at apex, depressed above, keeled beneath; antennæ clavate.
	Paphagus Walker (type P. sidæ Walk.).
13.	Metathorax with the lateral folds and usually the median carina present; abdomen ovate, beneath boat-
	shaped or carinate; flagellum clavate or subclavate, the club large, thicker than the funicle.
	Meraporus Walker (type M. graminicola Walk.).
	Metathorax with the lateral folds complete, the median carina absent; abdomen short oval, convex
	beneath; flagellum filiform or nearly, not or only slightly thickened towards apex, the joints trans-
	verse, the club subulate; head transverse, the vertex subacute, the temples flat and very narrow.
	Endomychobius Ashmead (type E. flavipes Ashm.).
15.	Metathoracic spiracles oval
	Metathoracic spiracles small, rounded.
	Metanotum without a median carina; abdomen conic-ovate, beneath subconvex, the second seg-
	ment occupying about one third the whole surface, segments 3-6 subequal, the 7th the long-
	est, the 8th conical; flagellum filiform, or at the most subclavate; marginal vein long, slightly
	thickenedScymnophagus Ashmead, g. nov. (type S. townsendi Ashm.).
16.	Metathorax very short, smooth, impunctate, with a median carina; scutellum convexly rounded; ab-
	domen short, ovate, not longer than the thorax, boat-shape beneath, the second segment occupying
	one third the surface, the following short, subequal.
	Epipteromalus Ashmead, g. nov. (type E. algonquinensis Ashm.).
17.	First two ring-joints minute, equal, smaller than the third; funicle joints wider than long; metathorax
	not short, the lateral folds incomplete, the spiracles oval; abdomen ovate, as long as the head and
	thorax united.
18.	Abdomen ovate, not longer than the head and thorax united, usually a little shorter, the apical mar-
	gins of the segments straight, not incised or emarginate
	Abdomen conic-ovate, often carinate beneath, and usually a little longer than the head and thorax
	united, the second segment the longest, the third usually the shortest, both sometimes, but not always,
	with a slight incision or emargination at apical middle; segments 4-6 most frequently increasing in
	length, the eighth conical; sometimes segments 2–5 are subequal

19.	Second abdominal segment about twice as long as the third or a little longer, segments 3-5 subequal, 6 and 7 longer; venter subconvex or convex. Pteromalus Swederus (type Ichneumon puparum Linné). Second abdominal segment about three times as long as the third, segments 4 and 5 united not longer than the third, those beyond variable, subequal in length; venter usually strongly compressed or keeled
20	. Marginal vein longer than the stigmal; metathoracic spiracles usually oblong-oval, close to the post-scutellar fold; funicle joints longer than thick, usually about twice as long as thick or nearly; abdomen not strongly carinate beneath towards base Catolaccus Thomson (type C. cavigena Thoms.). Marginal vein only a little longer than the stigmal; metathoracic spiracles small, short oval or sub-
	rotund; funicle joints very little longer than thick; abdomen strongly carinate beneath towards base
21.	Postmarginal vein longer than the stigmal vein, but rarely a great deal longer
	Postmarginal vein shorter than the stigmal vein, or of an equal length; pedicel small, usually much
	shorter than the first joint of the funicle; in a single case only is it much longer
22.	Antennæ with three ring-joints
	Antennæ with two ring-joints
23.	Metanotum very short, with a median carina and lateral folds, the latter intersected by a transverse
	carina or fold that extends on each side from the median carina; spiracles large, oblong; abdomen
	conic-ovate and somewhat produced at apex
	(type Catolaccus tylodermæ Ashm.).
24.	Pedicel shorter than the first joint of the funicle
	Pedicel longer than the first joint of the funicle
25.	Metanotum with a median carina and lateral folds, the spiracles usually large, long oval or linear;
	abdomen conic-ovate, keeled beneath; postmarginal vein not or only a little longer than the stigmal.
	Metapachia Westwood (type M. dispar Westw.).
	Metanotum with a median carina, the lateral folds wanting, the spiracles oval, not large; abdomen
	ovate, subcompressed beneath; postmarginal vein very longParapteromalus Ashmead, g. nov.
0.0	(type P. isosomatis Ashm.).
26.	Metanotum usually with a distinct median carina, the lateral folds incomplete, indicated toward the
	base, the spiracles oval or elliptic. Abdomen conic-ovate
	Abdomen rotund
27	Head wide, but the temples and cheeks rounded, not especially broad; pedicel shorter than the first
21.	joint of the funicle
	Head large, broad, the temples and the cheeks broad, acute; pedicel long, much longer than the first
	joint of the funicle.
	Antennæ inserted just above the clypeus; abdomen rotund, wider than the thorax, rarely ovate.
	Cœlopisthia Förster (type Pteromalus cephalotes Walk.).
28.	Antennæ inserted on or very near the middle of the face, never far below the middle
	Antennæ inserted far below the middle of the face.
	Metathorax not very short; abdomen ovate or conic-ovate, usually convex beneath.
	Dibrachys Förster (type Pteromalus boucheanus Ratz.).
29.	Abdomen conic-ovate, not much produced beneath, if at allArthrolytus Thomson.
	(type A. punctatus Thoms.).
	Abdomen conic-ovate, but beneath towards base, acutely triangularly produced.
	Metapachia Westw. (partim).

	ASHMEAD: CLASSIFICATION OF THE CHALCID FLIES 521
30.	Occipital foraminal depression distinctly margined or rimmed
	Occipital foraminal depression simple, immargined
31.	Metathorax at apex produced into a subglobose neck, the median carina and the lateral folds usually
	present.
	Antennæ with two ring-joints
	Antennæ with three ring-joints
32.	Eyes hairy
	Eyes bare, not hairy
33.	Postmarginal vein longer than the stigmal
9.4	Postmarginal vein not longer than the stigmal, usually a little shorter
34.	Second abdominal segment very large
	Second abdominal segment normal; flagellum subclavate, pubescent, the joints transverse or quadrate. Urolepis Walker.
25	Flagellum subclavate or clavate, clothed with a short pubescence, the joints usually much wider than
00.	long; tibiæ with rigid bristles; abdomen rotund, the second segment not especially large.
	Trichoglenes Thomson.
36.	Antennæ filiform, pubescent; funicle joints 4 to 6 usually a little wider than long or not longer than
00.	wide
37.	Metathorax at apex usually produced into a subglobose neck; postmarginal vein always longer than
	the stigmal
	Metathorax at apex normal; postmarginal vein rarely longer than the stigmal, most frequently shorter
	or of an equal length
38.	Legs normal, the middle tibiæ not dilated
	Legs abnormal, the middle tibiæ dilated toward tips; antennæ with the joints alternately white and
	brown
39.	Pedicel long, always longer than the first joint of the funicle
	Pedicel short, never longer than the first joint of the funicle, usually much shorter, the first joint of the
	funicle the longest of the funicle joints
40.	${\bf Metathoracic\ spiracles\ small,\ elliptic\ ;\ abdomen\ \ short\ \ oval,\ depressed\ ;\ flagellum\ \ filiform,\ pilose,\ the}$
	joints cup-shaped, transverse
	Metathoracic spiracles oval; abdomen boat-shaped; flagellum subfiliform or subclavate, pubes-
	cent, the club always longer and stouter than the pedicel
41.	Antennæ with two ring-joints
	Antennæ with three ring-joints?
42.	Metathoracic spiracles small, rounded
	Metathoracic spiracles not small, rounded
43.	Antennæ subclavate, pubescent; abdomen oblong-oval, flat, beneath at the most convex.
	Scymnophagus Ashmead.
44.	Metathoracic spiracles long oval or oblong, more rarely subreniform or linear
	Metathoracic spiracles smaller, oval or broadly oval.
1-	Metanotum very short, smooth, impunctate with a median carinaEpipteromalus Ashmead.
45.	Metathoracic spiracles long-oval or oblong. Abdomorphy and developments 2. 5 unequal gradually increasing in length, united a little
	Abdomen oblong-oval, dorsal segments 3-5 unequal, gradually increasing in length, united a little longer than the second; flagellum filiform, pubescent, the joints of the funicle about twice as
	long as thick or longer
	long as thick of fonger

	Metathoracic spiracles oblong, linear or subreniform.
	Abdomen oblong, at least $2\frac{1}{2}$ times as long as wide, dorsal segments 3-6 subequal; flagellum
	filiform, the joints of the funicle longer than thick Catolaccus Thomson.
46.	Postmarginal vein longer than the stigmal
	Postmarginal vein shorter than the stigmal or no longer
47.	Antennæ with two ring-joints
	Antennæ with three ring-joints.
	Metathorax short with a median carina and lateral folds, the latter intersected by a transverse
	carina which extends from the short median carina; the spiracles large, oblong. Neocatolaccus Ashmead.
48.	Metathorax with a distinct median carina, the lateral folds incomplete, the spiracles usually oval; head
	large, broad, the vertex broad
	Metathorax without a median carina, the lateral folds absent, the spiracles oval or ovate, not
	large; head transverse, not large, the temples flat
49.	Antennæ inserted on or near the middle of the face, or far above the clypeus
	Antennæ inserted far below the middle of the face or just above the clypeus.
	Head large, broad, the temples broad, acute; metathorax short, the lateral folds absent; abdo-
	men very short, rounded, depressed
	Head large, broad, but the temples rounded, not acute; metathorax not very short, the lateral
	folds complete; abdomen oblong-oval, depressed
50.	Antennæ subclavate, pubescent, the club much stouter than the funicle, the pedicel much longer than
	the first joint of the funiele
	Antennæ filiform, pubescent or pilose, the pedicel much shorter than the first joint of the funicle;
	funicle joints 1-4 distinctly longer than thick
	Subfamily II. Merisinæ.
	The absence of the spiracular sulci, an important character, alone distinguishes
thi	is tribe; otherwise it closely resembles the subfamily <i>Pteromalina</i> , its relationship
	- The state of the
	ing quite close through the tribe Eutelini, with the gall-inhabiting species in the
tri	be Merisini.
	I have recognized three tribes; the first being parasites of Coleoptera, the second
of	Diptera, while the third attack Rhynchota belonging to the homopterous fam-
	es Aphididæ, Aleurodidæ and Coccidæ.
1110	55 21pmaaa, 210000 0aaa ana 00000aa.
	TABLE OF TRIBES.
1.	Metanotum without a trace of a median carina
	Metanotum with the median carina more or less distinct or at least indicated basally; mesonotum with
	incomplete furrows
	Mesonotum with incomplete furrows
	Mesonotum with complete furrows
	Tribe I. Roptrocerini.
	White tribe is distinguished be the control of the property of the control of the

This tribe is distinguished by the metanotum, which always has a more or less distinct median carina; or at least it is never wholly absent as in the *Merisini* and the *Isoplatini*.

TABLE OF GENERA. 2. Ovipositor strongly exserted; marginal vein about twice as long as the stigmal vein or even longer; 3. Antennæ 13-jointed, inserted just above the clypeus; scape not attaining the ocelli; funicle joints 2-6 transverse, the club not stout, rounded at tip Anogmus Förster (type A. strobilorum Thoms.). Antennæ 13-jointed, inserted on the middle of the face or nearly, the flagellum stout, subclavate; funicle (type R. xylophagarum Ratz.). 4. Antennæ with two ring-joints; abdomen conic-ovate, pointed at tip. Abdomen longer than head and thorax united, carinate beneath, the third segment the shortest, segments 4 and 5 increasing in length, the sixth a little shorter than the fifth, seventh and eighth subequal, about as long as the fourth, the eighth conical with the spiracles distinct; Abdomen, as seen from above, conic-ovate, beneath compressed and strongly, triangularly carinate, as long as the thorax, segments 2-4 about equal, united not longer than the first, metathorax very short, smooth, but with a median carina, the spiracles rounded. Tropidogastra Ashmead, g. nov. (type T. arizonensis Ashm.). 5. Antennæ 13-jointed, with two ring-joints, inserted on or near the middle of the face 6 6. Metathoracic spiracles small, rounded; flagellum long, filiform; abdomen oblong-oval, fully as long as Metathoracic spiracles large, oval; flagellum shorter, subclavate; abdomen oblong-oval, a little longer than the thorax, subcarinate beneath towards base; marginal vein stout and not longer than the stig-Tribe II. Merisini. This tribe is at once separated from the *Isoplatini* by having *incomplete*, never complete, mesonotal furrows, the furrows at the most being indicated only anteriorly. TABLE OF GENERA. Metathorax terminating in a subglobose neck. First joint of the funicle short, much shorter than the pedicel; abdomen subovate or subrotund, the second segment (first body) occupying fully one half or more of the whole surface. Micromelus Walker (type M. rufomaculatus Walk.). 3. Marginal vein not or hardly longer than the stigmal vein, the front wings often with a submarginal or Marginal vein distinctly longer than the stigmal vein, the front wings without a submarginal or discoidal cloud.

Abdomen longer than the thorax and ending in a short or subexserted ovipositor.

Phænacra Förster.

Abdomen ovate, not longer than the thorax, the ovipositor not exserted, the second segmen (first body) occupying about one fourth the whole surface, the third segment small. Morisus Walker (type M. splendidus Walk.) Abdomen ovate, the dorsum usually flat, the second segment not occupying one fourth the whole surface, segments 3-6 subequal		
Merisus Walker (type M. splendidus Walk.) 4. Abdomen ovate, the dorsum usually flat, the second segment not occupying one fourth the whole sur face, segments 3-6 subequal		
4. Abdomen ovate, the dorsum usually flat, the second segment not occupying one fourth the whole surface, segments 3-6 subequal	(IIISC	
face, segments 3-6 subequal	4 Ahdomen ovat	
5. Metathorax not ending in a subglobose neck. Metathorax ending in a subglobose neck. Abdomen subrotund or short ovate, the second segment large, occupying one half or more of the whole surface; antennæ filiform, clothed with a short, fine pubescence. Micromelus Walker 6. Marginal vein not or scarcely longer than the stigmal vein. 7. Antennæ at apex stylate; abdomen oval, depressed. Antennæ at apex normal; abdomen oblong, narrowed, the second segment not quite as long as the three following united, which are short and subequal, the fourth very slightly the longest; antennæ filiform, rather densely pubescent. Merisus Walker 8. Abdomen short, spatulate, the second segment as long as or a little longer than the three following united, which are very short, the third the longest; antennæ filiform, densely pubescent. Homoporus Thomson TRIBE III. Isoplatini. In this tribe the mesonotal furrows are always distinct, complete, while the antennæ are usually inserted far anteriorly near the mouth border. TABLE OF GENERA. 1. Females. Males. 2. Non-metallic; mandibles variable, sometimes edentate. Abdomen compressed, the ventral valve prominent; stigmal vein as long as the marginal, end ing in a small knob. Isoplata Förster (type I. geniculata Först.) 3. Mandibles acute, edentate. Abdomen conic-ovate; antennæ short, strongly clavate, inserted near the mouth border, the pedicel large; stigmal vein as long as the marginal, clavate. Cœlocyba Ashmead (type C. nigrocineta Ashm.) 4. Abdomen short, globose, depressed above; marginal vein not or scarcely longer than the stigmal vein metathorax very short. Stigmal vein ending in a small knob; abdomen with the first dorsal segment elongate, occupy ing half or more of the whole surface. Terobiella Ashmead (type T. flavifrons Ashm.) Stigmal vein ending in a moderately large knob; abdomen with the dorsal segments short. Brachyscelidiphaga Ashmead (type B. flava Ashm.) 5. Non-metallic; mandibles dentate 6. Mandibles acute, edentate		
Metathorax ending in a subglobose neck. Abdomen subrotund or short ovate, the second segment large, occupying one half or more of the whole surface; antenme filiform, clothed with a short, fine pubescence. Micromelus Walker 6. Marginal vein always distinctly longer than the stigmal vein. 7. Antenme at apex stylate; abdomen oval, depressed. 7. Antenme at apex normal; abdomen oblong, narrowed, the second segment not quite as long as the three following united, which are short and subequal, the fourth very slightly the longest; antenna filiform, rather densely pubescent. 8. Abdomen short, spatulate, the second segment as long as or a little longer than the three following united, which are very short, the third the longest; antenna filiform, densely pubescent. Homoporus Thomson TRIBE III. Isoplatini. In this tribe the mesonotal furrows are always distinct, complete, while the antenna are usually inserted far anteriorly near the mouth border. TABLE OF GENERA. 1. Females. Males. 2. Non-metallic; mandibles variable, sometimes edentate. Metallic; mandibles dentate. Abdomen compressed, the ventral valve prominent; stigmal vein as long as the marginal, end ing in a small knob. Isoplata Förster (type I. geniculata Först.) 8. Mandibles acute, edentate. Mandibles broad, dentate. Abdomen conic-ovate; antennæ short, strongly clavate, inserted near the mouth border, the pedicel large; stigmal vein as long as the marginal, clavate. Calocyba Ashmead (type C. nigrocineta Ashm.) 4. Abdomen short, globose, depressed above; marginal vein not or scarcely longer than the stigmal vein metathorax very short. Stigmal vein ending in a small knob; abdomen with the first dorsal segment elongate, occupy ing half or more of the whole surface. Terobiella Ashmead (type T. fluvifrons Ashm.) 5. Non-metallic; mandibles acute or broad, dentate. Brachyscelidiphaga Ashmead (type B. flava Ashm.) 5. Non-metallic; mandibles dentate. Mandibles acute, edentate.		
the whole surface; antennæ filiform, clothed with a short, fine pubescence. Micromelus Walker 6. Marginal vein always distinctly longer than the stigmal vein		
Micromelus Walker 6. Marginal vein not or scarcely longer than the stigmal vein Marginal vein not or scarcely longer than the stigmal vein 7. Antennæ at apex stylate; abdomen oval, depressed. Antennæ at apex normal; abdomen oblong, narrowed, the second segment not quite as long as the three following united, which are short and subequal, the fourth very slightly the longest; antennæ filiform, rather densely pubescent. Merisus Walker 8. Abdomen short, spatulate, the second segment as long as or a little longer than the three following united, which are very short, the third the longest; antennæ filiform, densely pubescent. Homoporus Thomson TRIBE III. Isoplatini. In this tribe the mesonotal furrows are always distinct, complete, while the an tennæ are usually inserted far anteriorly near the mouth border. SUBFAMILY III. EUNOTINÆ.

- 1863. Muscidides Motschulsky, Bull. Soc. Imp. Nat., XXXVI, 1863 (2), p. 69.
- 1872. Family? Walker, Notes on Chalc., VI., p. 100.
- 1898. Muscideinæ, Subfam. dubia, Dalla Torre, Cat. Hym., V, p. 87.

This small subfamily comprises a number of genera, all evidently of tropical origin, and all parasites of the rhynchotous family *Coccide*.

The first genus to be described was *Eunotus* Walker, in 1834. It was later named *Trituphus* by Ratzeburg, and again rechristened *Megapelte* by Förster.

In 1863 Motschulsky described, briefly, poorly, and sometimes inaccurately, several new genera from Ceylon, which belong here, and proposed for the group the name *Muscidides*, stating that "Ils se distinguent des Pteromalides par leur forme plus raccourcie et plus large, qui rappelle celle des Chalcidides et par leur mésonotum, qui prend quelquefois une telle extensione, qu'il recouvre tout l'abdomen, comme ches les Scutellaires parmi Hémiptères, ce qui fait replier les ailes horisontalement sous ce mésonotum d'une manière analogue. Les ailes sont pubescent comme chez les Pteromalides."

The genus *Eunotus* Walker, was described twenty years before *Muscidea* Motschulsky, and I prefer to call the group *Eunotina*, after the first described genus, in accordance with the rules of zoölogical nomenclature, rather than the *Muscideina*, the term *Muscidides* not being tenable.

Cephaleta Motschulsky, if I have identified it correctly, belongs here, but Motschulsky correlated with it a male insect with branched antennæ, which, from the description and the poor figure, I think is a Eulophid, and probably identical with Pentacladia Westwood, described in 1835.

1.	Females.	. 2
	Males	. 12
2.	Scutellum large, but not extending beyond the base of the abdomen	. 8
	Scutellum abnormally large, extending over most of the abdomen.	5
	Head very wide, lenticular, wider than the thorax; antennæ 8 or 9-jointed, the flagellum	cla
	vateScutellista Motschulsky (type S. cyanea Motsc	ch.).
3.	Second dorsal abdominal segment much shorter, at the most occupying only a little more than half	f heta
	whole surface of the abdomen	5

	Second dorsal abdominal segment long, occupying nearly the whole surface of the abdomen; eyes
	pubescent.
	Antennæ 9-jointed; scutellum twice the length of the mesonotum.
	Euargopelte Förster (type E. obscura Först.).
	Antennæ 10-jointed; scutellum not twice the length of the mesonotum.
	Eunotus Walker (type E. cretaceus Walk.).
5.	Postmarginal vein rather short, not longer than the stigmal vein, sometimes shorter
	Postmarginal vein not short, always longer than the stigmal vein.
	Antennæ 9-jointed or less
	Antennæ 10-jointed, the joints large, depressed, and narrowed toward apex; body greenish
	metallic, punctate
e	
0.	Antennæ 7-jointed or less
	Antennæ 8-jointed, clavate, funicle joints 2-4 transverse.
	Muscidea Motschulsky (type M. pubescens Motsch.).
7.	Antennæ 7-jointed, subclavate, the last joint large, oval, joints 2–4 not transverse.
	Cardiogaster Motschulsky (type C. fusciventris Motsch.).
	Antennæ 6-jointed, filiform, depressed, joints 3-5 nearly equal, the sixth a little longer, acuminate at
	apex Solenoderus Motschulsky (type S. cyaniventris Motsch.).
8.	Antennæ 9-jointed, or less
	Antennæ 10-jointed
9.	Antennæ 8-jointed or less
	Antennæ 9-jointed?genus.
10.	Antennæ 7-jointed 11
	Antennæ 8-jointed Eurycranium Ashmead * (type E. alcocki Ashm.).
11.	Antennæ 7-jointed
	Scutellum not extending beyond the base of the abdomen
12.	Scutellum abnormally large, covering most of the abdomen
19	Abdomen with the second dorsal segment shorter, not nearly occupying the whole of the surface. 14
	Abdomen with the second segment large, occupying nearly the whole surface; eyes pubescent.
	Antennæ 10-jointed Eunotus Walker.
- 4	Antennæ 9-jointed Euargopelte Förster.
14.	Postmarginal vein well developed, always longer than the stigmal
. W	Postmarginal vein not well developed, not longer than the stigmal, sometimes shorter
15.	Antennæ 9-jointed or less
	Antennæ 10-jointed
16.	Antennæ 8-jointed or less
	Antennæ 9-jointed, filiform
17.	Antennæ 8-jointed
	Antennæ 7-jointed
18.	Antennæ 9-jointed.
-	Lateral ocelli almost touching the eye margin
	Lateral ocelli twice their width from the eye margin Eurycranium Ashmead.
	Antennæ (?) 7-jointed, with 5 branches.
	Cephaleta Motsch. (partim)? = Pentacladia Westw., a Eulophid.

SUBFAMILY IV. SPHEGIGASTERINÆ.

- 1856. Miscogasteroidæ, Familie 14 (partim), Förster, Hym. Stud., II., p. 24.
- 1856. Miscogastroidæ, Familie 14 (partim), opus cit., p. 51.
- 1875. Sphegigastrides, Subtribus (partim), Thomson, Hym. Skand., IV., p. 217.
- 1875. Caratomides, Subtribus, Thomson, opus cit., p. 216.
- 1887. Pteromalinæ, Subfamily (partim), Howard, Ent. Amer., II., pp. 33 and 35.
- 1897. Sphegigasterinæ, Subfamily III., Ashmead, Proc. Ent. Soc. Washington, IV., p. 248.
- 1898. Chrysolampinæ, Subfamily, Dalla Torre, Cat. Hym., V., p. 16.

This subfamily is distinguished from the three preceding subfamilies by the distinctly petiolated abdomen, and from the two which are to follow, which also have the abdomen petiolate, by other characters; from the *Spalangiinæ* by having a totally different shaped head, and by the venation; from the *Diparinæ* by thoracic and antennal characters.

Four very distinct minor groups, here called tribes, have been recognized.

TABLE OF TRIBES.

	·	
1.	Antennæ inserted near the mouth border or just above the clypeus	2
	Antennæ inserted on or near the middle of the face, far above the clypeus	3
2.	Head usually lenticular, much wider than the thorax, deeply concave behind, rarely normal; parapa	si-
	dal furrows complete	ıi.
3.	Front wings with a slender marginal vein	4
	Front wings with a thick, stout, usually short marginal vein	ni.
4.	Head transverse, the temples not very broad	ni.
	Head very large, the temples very broad, the frons sometimes cornutedTribe IV. Cratomin	ai.

Tribe I. Asaphini.

This tribe is readily distinguished from the others in the subfamily by the antennæ being inserted near the mouth border, or just above the clypeus; they are never inserted near the middle of the face.

It is based upon the genus Asaphes Walker, which was rechristened Isocratus by Dr. Förster, and placed by him in the subfamily Spalangiine, with which group it has nothing in common.

The habits of the genera falling in this tribe are fairly uniform, the vast majority of the species being parasites upon plant-lice, *Aphidida*, and upon the bark-lice, *Coccida*.

1.	Females	. 2
	Males	

2.	Head very wide, the occiput strongly concave
	Head not especially wide, the occiput not strongly concave 6
3.	Winged
	Wingless or subapterous.
	Antennæ strongly clavate, 9-jointed, ending in a large, solid ovate club, the scape dilated at
	apex; funicle 6-jointed, joints 2-6 transverse, the sixth about four times as wide as long; me-
	tathorax very short, without carinæ, the spiracles small, rounded; abdomen oval, the petiole
	scarcely longer than thick, the third segment (second body segment) a little longer than the
	second
4.	Antennæ 10-jointed
	Antennæ 13-jointed9
5.	Abdomen with the second segment abnormally large, occupying most of the surface.
	Marginal vein scarcely longer than the stigmal vein, the postmarginal vein wanting; body of
	abdomen with a tuft of hairs on each side at base.
	Tomocera Howard (type T. californica How.).
	Marginal vein fully twice as long as the stigmal vein, the postmarginal vein distinct, about the
	length of the stigmal; no tuft of hairs at base of abdomen.
	Ophelosia Riley (type O. crawfordi Riley).
6.	Marginal vein about three times as long as the stigmal vein or a little longer
	Marginal vein short, at the most scarcely twice as long as the stigmal vein, usually shorter 8
7.	Antennæ 10-jointed, the second joint of the funicle twice as long as the first; scutellum with a cross-
	furrow before the apex
	Antennæ 13-jointed
8.	Marginal vein hardly twice as long as the stigmal vein, the postmarginal vein very short; antennæ
	10-jointed, the joints of the funicle short, submoniliform; scutellum without a cross-furrow before
	the apex
	Marginal vein hardly as long as the stigmal vein, the postmarginal vein long; antennæ 13-jointed, with
	2 ring-joints
9.	Marginal vein about thrice as long as the stigmal vein.
	Parasaphes Ashmead, g. nov. (type P. iceryæ Ashm.).
10.	Antennæ 9 or 10-jointed; head usually wide
	Antennæ 13-jointed; head normal
11.	Postmarginal vein wanting or very short
	Postmarginal vein distinct, about the length of the stigmal vein.
	Marginal vein twice as long as the stigmal; no tuft of hairs at base of scutellum.
	Ophelosia Riley.
12.	Marginal vein long, about twice as long as the stigmal or even thrice as long
	Marginal vein short, hardly as long as the stigmal.
	Abdomen with a tuft of hairs on each side at base; antennæ dentateTomocera Howard.
13.	Antennæ 9-jointed.
	Scutellum without a cross-furrow before apex
4.4	Scutellum with a cross-furrow before apex
14.	Marginal vein scarcely as long as the stigmal vein, a little thickened at base, the postmarginal vein
	long Asaphes Walker. Marginal value as long as the stimul value.
	ranginal vein about thrice as long as the sugmai vein rarasaphes Ashmead.
	Marginal vein about thrice as long as the stigmal vein

Tribe II. Pachyneurini.

In this tribe the antennæ are inserted near the middle of the face, and the marginal vein in the front wings is always thickened and usually short.

The species, like the *Asaphini* are said to be parasites of coccids and aphids, but these insects have other hymenopterous parasites, braconids, encyrtids, cynipids, etc., and the *Pachyneurini* are probably hyperparasites of these insects.

A few have also been bred from dipterous insects belonging to the family *Syrphide*, which also have other hymenopterous parasites, and this seems to confirm the hyperparasitism of these insects.

TABLE OF GENERA. 3. Stigmal vein with a large knob; abdomen ovate, pointed at apex, the second segment large, the third segment very short, the fourth and fifth rather large, subequal, the following very short. Pachycrepis Förster (type Caruna clavata Walk.). Stigmal vein with a small knob; abdomen ovate, the second and the third segments large, the fourth and fifth very short, the sixth and seventh longer. Pachycrepoideus Ashmead, g. nov. (type P. dubius Ashm.). 5. Pronotum much narrower than the mesonotum across the shoulders; abdomen oval or short ovate, the second segment the longest, occupying a good portion of the surface, the third and fourth short, nearly Pronotum as wide as the mesonotum across the shoulders; scutellum with a cross-furrow just before the apex; abdomen seen from above ovate, nearly as long as the head and thorax united, beneath compressed or keeled, the ventral valve prominent, plowshare-shaped, the second segment fully twice as long as the third, or longer, the fourth a little longer than the third, the following subequal, the sixth as long or a little longer than the fifth..................Euneura Walker (type E. augarus Walk.). 6. Pronotum narrower than the mesothorax; scutellum without a cross-furrow before apex; abdomen ovate, the second segment the longest, the third, fourth and fifth not short, subequal, the fourth a little the longest, the sixth about one third shorter than the fifth. Hypsicamera Förster (type H. ratzeburgii Reinhard). Mesothoracic furrows complete. Stigmal club large. Pachycrepis Förster. Pachycrepis Förster. Stigmal club small Pachycrepoideus Ashmead. 8. Pronotum as wide as the mesonotum; scutellum with a cross-furrow before the apex. Euneura Walker. Pronotum narrower than the mesonotum; scutellum without a cross-furrow before apex. Metanotum rather short; funicle joints not more than twice as long as thick. Pachyneuron Walker.

Tribe III. Sphegigasterini.

The species falling in this tribe are easily recognized by the much longer and more slender marginal vein. They differ from the others also in habits, the majority of the species being parasites of dipterous insects, and especially of the gall-making species belonging principally to the family *Cecidomyiidæ*.

TABLE OF GENERA. Abdominal petiole shorter than the hind coxæ, or at least never longer..... 3. Head with the cheeks compressed, the vertex not very narrow...... 4 Head sublenticular, the cheeks rounded, the vertex narrow. Pronotum large, quadrate, mesonotum flat, with complete parapsidal furrows; second abdominal segment very large, occupying fully two thirds of the whole surface of the abdomen, the Mesothoracic furrows complete, distinct. Scutellum with a cross-furrow before the apex; abdomen short oval, keeled beneath, the second and third segments very large, the second broadly emarginate at apical margin. Merismus Walker (type M. megapterus Walk.). Scutellum convex, without a cross-furrow before the apex, the second segment large, occupying a little more than half the whole surface of the abdomen, the apical margin straight, not 5. Metanotum usually smooth, but always with a median carina (except sometimes in Polycyrtus), the lateral folds also usually present 6 Metanotum punctate, without either a median carina or lateral folds. Scutellum convex, without a cross-furrow before the apex; abdomen with the second and third segments very large; sometimes the abdomen is triangulate as in Perilampus. Trigonogastra Ashmead, g. nov. (type T. aurata Ashm.). 6. Scutellum with a delicate cross-furrow before the apex; abdomen with the second and third segments (type S. pallicornis Spin.). Scutellum without a cross-furrow before the apex or the furrow is subabsolute; abdomen with the second segment very large, occupying half or a little more than half the whole surface, the following Mesothoracic furrows complete, distinct, rarely only two thirds the length of the mesonotum..... 13 8. Metanotum not broad, and with a more or less distinct median carina, or at least the carina is indicated basally......9 9. Second abdominal segment at apex broadly and usually deeply, semicircularly emarginate...... 10 Second abdominal segment at apex not broadly and deeply emarginate, straight or at the most with

10.	Abdomen ovate, the second and third segments very large, occupying the larger part of the surface.
	Cyrtogaster Walker (type C. vulgaris Walker).
11.	Metanotum punctate, with an abbreviated median carina
	Metanotum smooth, impunctate, but with a distinct median carina.
	Pronotum anteriorly not acute; axillæ separated at base of scutellum; abdomen ovate or conic-
	ovate, the second segment large, occupying about half the whole surface.
	Polycystus Westwood (type P. matthewsii Westw.).
	Pronotum anteriorly acute; axillæ meet at base of scutellum; abdomen triangulated, much as
	in Perilampus, the second segment large
12	Abdomen short, ovate, wider than the thorax, but a little shorter, the second segment twice the length
	of the third, the apical margin entire, the following segments gradually shortening.
10	Eurydinota Förster (type E. leptomera Förster).
15.	Abdomen with the second segment occupying fully one third the whole surface, 3 to 5 subequal in
	length, the sixth longer than the fifth, the two following very short.
	Pterosema Förster (type P. variicolor Först.).
14.	Metanotum not closely punctate and tricarinate
	Metanotum not long, and smooth, the median carina and lateral folds usually present.
	Middle tibiæ normal; abdomen ovate, pointed at apex, the petiole shagreened, with a median
	ridge, the second segment the largest, occupying about half the whole surface, with a slight
	incision at apex
	Middle tibiæ abnormal, incrassate; abdomen short ovate
	(type S. dissimilis Walk.).
15.	Abdomen conic-ovate, the petiole rugulose, the second segment occupying at the most one third the
	whole surface, the following segments subequal, less than half the length of the second; pronotum
	not shortBubekia Dalla Torre (type Brachycrepis tricarinata Ashm.).
16.	Petiole of abdomen long, always longer than the hind coxe
	Petiole of abdomen shorter, not longer than the hind coxæ
17.	Mesothoracic furrows complete
	Mesothoracic furrows incomplete, indicated only anteriorly
18	Head with compressed cheeks; pronotum not large, not transverse quadrate
20.	Head sublenticular, with rounded cheeks, the vertex antero-posteriorly narrow; antennæ filiform,
	pubescent
10	Scutellum with a cross-furrow before apex. 20
19.	
20	Scutellum without a cross-furrow before apex
20.	Abdomen with dorsal segments 2 and 3 large, the second twice the length of the third and deeply,
	broadly, semicircularly emarginate at apex; flagellum subclavate, pubescent Merismus Walker.
	Abdomen ovate, the second dorsal segment large, occupying more than half the whole surface, not
	emarginate at apex
21.	Metanotum usually smooth, with lateral folds and a median carina; both mandibles 4-dentate 24
	Metanotum closely punctate and often, but not always, without lateral folds or a median carina, rarely
	distinct
22.	Abdomen not triangular, either oval or oblong-oval
	Abdomen triangular; mandibles 4-dentate, the outer tooth acute; pronotum anteriorly truncate, the
	upper front margin acute
23.	Metathorax not long, but produced into a subglobose neck at apex; both mandibles 3-dentate 24

	Metathorax long and also produced into a subglobose neck at apex; pronotum with the front margin
0.4	rounded; both mandibles 4-dentate
	Palpi normal
	Palpi abnormal
	Middle tibiæ abnormal, incrassated at apex
	Middle tibiæ normal.
	Abdomen with dorsal segments 2 and 3 largeSphegigaster Spinola.
26.	Abdomen with the second segment large, occupying most of the surface, its apical margin not incised.
	* Cryptoprymna Förster.
	Abdomen with the second segment not so large, its apical margin usually with a slight incision;
	antennæ, except the club, usually yellow
27.	Abdomen short, the second segment at apex not incised
28.	Antennæ filiform? g. nov.
29.	Mesothoracic furrows incomplete or indicated only anteriorly
	Mesothoracic furrows complete
30.	Metanotum smooth or at the most feebly punctate
	Metanotum punctate or sculptured, opaque.
	Abdomeu triangular; pronotum anteriorly truncate, the upper margin acute.
	Trigonogastra Ashmead.
	Abdomen oblong-oval; pronotum anteriorly rounded, the upper margin not acute.
	Bubekia Dalla Torre.
31.	Second dorsal abdominal segment at apex, not broadly, deeply semicircularly emarginate, either
	straight or with only a slight incision
	Second dorsal abdominal segment at apex broadly and deeply semicircularly emarginate.
	Cyrtogaster Walker.
32.	Head wide but not thick; antennæ subfiliform, the second ring-joint larger than the first, the scape
	slender, but hardly reaching to the front ocellus, the funicle joints not longer than thick.
	Polycyrtus Westwood.
	Head large and thick, much wider than the thorax; antennæ clavate, the ring-joints equal, annular,
	the scape long and slender
33.	Metanotum with one or three carinæ
	Metanotum broad, without a median carina.
	Abdomen with the second segment occupying fully one third the whole surface.
	Pterosema Förster.
34.	Metanotum with the lateral carinæ or folds wanting, the median carina present, usually abbreviated.
	Eurydinota Förster.
	Metanotum long, closely punctate, tricarinate
	Tribe IV. Cratomini.
187	75 Caratomides Subtribus Thomson Hym Skand IV n 216

1875. Caratomides, Subtribus, Thomson, Hym. Skand., IV., p. 216.

1878. Caratomides, Subtribus, Thomson, opus cit., V., p. 44.

This group is based upon the genus *Cratomus* Dalman, established in 1820. Later the genus was changed to *Caratomus*. I have however, retained the original spelling and shall call the group *Cratomini*.

Haliday thought *Cratomus* was allied to the *Perilampidæ* and placed it in that family, an unnatural position for it. It is a true *Pteromalid* and falls into the subfamily *Sphegigasterinæ*, as is abundantly proved by the discovery of my genus *Paracaratomus*.

Nothing is positively known of the habits of this minor group, but I suspect that the group is parasitic upon the larvæ of beetles.

TABLE OF GENERA.

Head not cornuted; face with converging strike below the insertion of the antennæ; abdomen longly petiolate, the body subcompressed towards apex, the petiole nearly twice as long as the hind coxæ.

Paracaratomus Ashmead (type P. cephalotes Ashm.).

SUBFAMILY IV. SPALANGIINÆ.

- 1840. Spalangiides, Subfamily? (partim), Westwood, Intro. Mod. Class. Ins., II., Synop., p. 66.
- 1856. Spalangoide, Familie 6 (partim), Förster, Hym. Stud., II., pp. 18, 22 and 40.
- 1875. Spalangiina, Tribus (partim), Thomson, Hym. Skand., IV., pp. 12 and 206.
- 1886. Spalangiinæ, Subfamily (partim), Howard, Ent. Amer., I., p. 198.
- 1897. Spalangiinæ, Subfamily IV., Ashmead, Proc. Ent. Soc. Washington, IV., p. 248.

This subfamily is quite distinct from all of the others here defined by the peculiar oblong shape of the head, a character found in no other family in the Chalcidoidea, except in the family Agaonidae, although not uncommon among the Aculeales, especially in the superfamily Vespoidea, the oblong head being one of the principal characters that distinguishes the family Bethylidae; it is also reproduced in the Chrysididae and occasionally in two or three other families.

Dr. Förster and others incorrectly placed here the genus Asaphes Walker (= Iso-cratus Förster); it is a genuine Pteromaline.

The subfamily *Spalangiinæ* is readily distinguished by the oblong shape of the head, by the antennæ being inserted far anteriorly close to the mouth, by the longer more depressed thorax, by the shape of the pronotum, by the petiolated abdomen, and by the venation of the front wings, the costal cell being long and exceedingly narrow.

The species of *Spalangia* are parasitic on dipterous larvæ. The species in the other genera, according to the records, destroy coleopterous larvæ.

TABLE OF GENERA. 1. Females. 2 Males. 5

FAMILY LXX. ELASMIDÆ.

- 1840. Eulophides, Subfamily 5 (partim), Westwood, Intro. Mod. Class. Ins., II.; Synop., p. 73.
- 1846. Eulophidæ, Family II. (partim), Walker, List Chalc. Brit. Museum, I., p. 61.
- 1856. Elasmoidæ, Familie 17, Förster, Hym. Stud., II., pp. 19, 25 and 71.
- 1878. Elasmina, Tribus, Thomson, Hym. Skand., V., p. 180.
- 1886. Elasminæ, Subfamily, Howard, Ent. Amer., I., p. 198.
- 1897. Elasmidæ, Family LXX., Ashmead, Proc. Ent. Soc. Washington, IV., p. 236.

This family is not closely allied to any other, although, on account of the 4-jointed tarsi, and the flabellate antennæ in the males, it deceptively resembles the family *Eulophidæ*. Structurally, however, the two families are totally distinct, the thorax, the front wings, the legs and the abdomen being quite different in these families.

In mesothoracic and abdominal characters the *Elasmidæ* show some affinity with the *Encyrtidæ*, but the relationship, if it ever existed, must have been very remote, in ages past, and it is not now traceable in the forms thus far discovered.

The group is easily recognized by the compressed, triangular shape of the body and abdomen, by the longer and narrower wings, by the venation, the marginal vein being usually, although not always, very long, with the stigmal vein very short, and by the abnormally developed legs, the hind coxæ being very large, strongly compressed, disk-like, the hind femora being rather stout, the tibiæ and tarsi being very slender, the latter being very long.

The species of *Elasmus* attack usually lepidopterous larvæ, but some have also been bred from microgasterid cocoons and from other insects. The Australia genus *Euryischia* Howard, attacks dipterous larvæ.

FAMILY LXXI. EULOPHIDÆ.

- 1840. Eulophides, Subfamily 5 (partim), Westwood, Intro. Mod. Class. Ins., p. 166; Synop., p. 73.
- 1843. Eulophini, Subfamily (partim), Haliday, Trans. Ent. Soc. London, III., p. 296.
- 1856. Myinoidæ, Familie 3 (partim), Förster, Hym. Stud., II., pp. 18, 21 and 30.
- 1856. Elachistoide, Familie 18 (partim), Förster, Hym. Stud., II., pp. 19, 26 and 72.
- 1856. Eulophoidæ, Familie 19 (partim), Förster, Hym. Stud., II., pp. 19, 26 and 74.
- 1856. Entedonoidæ, Familie 20 (partim), Förster, Hym. Stud., II., pp. 19, 26 and 78.
- 1856. Tetrastichoidæ, Familie 21 (partim), Förster, Hym. Stud., II., pp. 19, 26 and
- 1878. Tetrastichina, Tribus (partim), Thomson, Hym. Skand., V., p. 180.
- 1885. Tetracampinæ, Subfamily (partim), Howard, Ent. Amer., I, p. 198.
- 1886. Tetracampinæ, Subfamily (partim), Howard, Ent. Amer., II., p. 98.
- 1900. Eulophidæ, Family LXXI., Ashmead, Proc. U. S. National Museum, XXIII., p. 203.

This very large family, which comprises mostly very small species, is separated from all the previously described families, except the *Elasmide*, by thoracic and pedal characters, and to a great extent also by venational peculiarities impossible to describe in detail to any except to those who have a thorough knowledge of the various families.

The principal points to be noted, however, are the axillæ which are advanced forward into the basal region of the parapsides, on or before an imaginary line drawn from tegula to tegula, a character found in none of the foregoing families, except the Elasmidæ which is too obviously distinct in many other ways to require specification again.

Five distinct subfamilies may be recognized by the aid of the following table:

TABLE OF SUBFAMILIES.

	TRIBLE OF COSTABILITIES.
1.	Submarginal vein entire, not distinctly broken, or interrupted before uniting with the marginal vein, and usually distinctly longer than the marginal; stigmal vein long, distinct, rarely very short, the post-
	marginal vein always present
	Submarginal vein broken, or interrupted before uniting with the marginal vein, and most frequently,
	but not always, very short; stigmal vein not or rarely long, usually very short, the knob most
	frequently subsessile or subpetiolate, the postmarginal most frequently wanting or very short, rarely
	long
2.	Submarginal vein very short, the marginal vein very long, the postmarginal vein variable, often very
	short or only slightly developed; metapleura very small; abdomen often petiolate, but sometimes
	sessile or subsessileSubfamily I. Entedoninæ.
	Submarginal vein not very short, usually longer than the marginal, the postmarginal vein always
	wanting; abdomen usually sessile, rarely petiolate.
	Stigmal vein very short, nearly obsolete, its knob sessile or subsessile; mesopleura usually
	without a femoral furrow
	Stigmal vein distinct, never subsessile, usually long; mesopleura always with a distinct femoral
	furrow
3.	Mesonotum with the parapsidal furrows complete, distinct, entireSubfamily IV. Elachertinæ.
	Mesonotum with the parapsidal furrows wanting or incomplete, at the most only slightly indicated
	anteriorly

SUBFAMILY I. ENTEDONINÆ.

1897. Entedoninæ, Subfamily I., Ashmead, Proc. Ent. Soc. Washington, IV., p. 236. The usually very long marginal vein, the usually very short stigmal vein, which is rarely long, the very small metapleura, and peculiarities in the shape of the head and abdomen, impossible to describe in detail, but which the trained eye recognizes at once, must be depended upon to distinguish the group.

The subfamily may be divided into four distinct tribes or minor groups.

TABLE OF TRIBES.

TRIBE I. TETRACAMPINI.

- 1856. Tetracampoidæ, Familie, Förster, Hym. Stud., II., p. 79.
- 1878. Tetracampina, Tribus, Thomson, Hym. Skand., V., p. 181.

This tribe approaches nearest to the *Omphalini*; the body is rather narrow and elongate, the abdomen in the female being usually longer than the head and thorax

united and conically produced or conic-ovate; while the marginal vein is very long, the stigmal vein minute. In the females the tarsi are 5-jointed or heteromerous, in the males 4-jointed. The antennæ are 11-, 12- or 13-jointed, with 1 or 2 ring-joints, the funicle being 6-jointed.

In the other tribes the tarsi are 4-jointed in both sexes, the antennæ having at the most 10 joints, while the funicle is from 2- to 5-jointed.

The members of this tribe attack principally coleopterous larvæ.

TABLE OF GENERA.

1.	Females; tarsi 5-jointed or heteromerous	2
	Males; tarsi 4-jointed	6
2.	Antennæ 12- or 13-jointed, with 1 or 2 ring-joints	3
	Antennæ 11-jointed, without a ring-joint	5
3.	Antenuæ 12-jointed; mesonotal furrows distinct	4
	Antennæ 13-jointed, with 2 ring-joints, the scape slender, the club 3-jointed, the funicle 6-jointed, the	he
	joints long, cylindrical; mesonotal furrows wanting.	
	Platynocheilus Westwood (type P. erichsonii Westw	.).

- 4. Antennæ with the scape stout, the flagellum filiform, the joints cylindrical; stigmal vein very short with Antennæ with the scape slender, the flagellum subclavate, the joints except 5 and 6 a little longer than thick; stigmal vein short but with a rather large rounded knob...Plutothrix Förster (type unknown).
- 5. Scape not thick, the pedicel about as long as funicle-joints 1 and 2 united, the fifth joint stout; pronotura as long as the mesonotum, the axillæ widely separated; metanotum without a median carina.

Försterella Dalla Torre (type Hyperbius flavipes Först.).

- 7. Antennæ 11-jointed 8 Antennæ 12-jointed.

Flagellum not verticillate-pilose; stigmal vein with a minute knob.......Tetracampe Förster.

8. Antennæ with the scape broad, the pedicel long, the flagellum normal; stigmal vein very short.

Försterella Dalla Torre.

Tribe II. Omphalini.

Many of the species falling in this tribe strongly resemble some in the Tetracampini, in venation, in the shape of the body and in often having the abdomen conically produced, the only appreciable difference being in the antennæ; these are never more than 10-jointed, and the funicle is at the most 5-jointed, often 2-, 3- or 4-jointed.

The habits of the species, if the records are correct, are diverse. Some attack the larvæ of Coleoptera, while others attack those of Diptera, Lepidoptera, etc.

I am inclined to think, however, that these records in some cases are wrong and most of them will be found to be parasitic only on dipterous larvæ, since, where the records conflict, Diptera are usually associated with the Coleoptera and Lepidoptera, either as parasites or living together in the same plant. In breeding parasites one cannot always ascertain, with absolute certainty, the host of the parasites.

Species belonging to the genus Astichus Förster are bred from fungi infested with dipterous and coleopterous larvæ.

TABLE OF GENERA. 2. Antennæ 10-jointed, with one ring-joint (scape, pedicel, a ring-joint, a 4-jointed funicle and a 3-jointed Wings banded or maculate with fuscous. Antennæ very long, the flagellum subclavate; abdomen conically pointed; postmarginal vein short, the knob of the stigmal vein petiolate... Astichus Förster (type A. arithmetricus Först.). Abdomen short, ovate or cordate and usually shorter than the thorax, never much longer...... 8 Metanotum long, distinctly tricarinate, the surface punctulate or rugulose. Flagellum stout, subclavate, finely pubescent; abdomen not longer than the head and thorax Metanotum punctate or sculptured. Wings almost glabrous, the short pubescence arranged in hair lines, usually conforming to the

7. Front wings well pubescent; postmarginal vein well developed, long.

Eyes not large, the malar space distinct; scape of antennæ metallic or metallic except at base. Euderus Haliday (type Entedon amplus Walk.).

Eyes very large, pubescent, occupying the whole side of the head and extending to the base of the mandibles, the malar space wanting; scape very slender, white.

Euophthalmomyia Ashmead, g. nov. (type E. pallidipes Ashm.).

Front wings almost glabrous, not well pubescent, the pubescence arranged in more or less irregular hair-lines, as in Secodes; postmarginal vein not well developed, not or scarcely longer than the very short subsessile stigmal vein; eyes normal, the malar space distinct.

Omphale Haliday (type O. salicis Hal.).

- 8. Wings bare or nearly, the stigmal vein rather long, the postmarginal vein not developed.
 - Flagellum subclavate, not long, the pedicel long, obconical, the funicle 4-jointed, joints 3 and 4 wider than long; head lenticular, wider than the thorax; parapsidal furrows sharply defined posteriorly, wanting at anterior third; metathorax short, punctate, with a median carina;
- Antennæ 9-jointed, with a ring-joint, the funicle 3-jointed, the club 3-jointed, the terminal joint usually represented by a spur; wings immaculate, or at most with a substigmal fascia; metathorax smooth, without a median carina or lateral folds, but with spiracular sulei; abdomen not or scarcely longer than the head and thorax united.

Malar space distinct, the eyes not extending to the base of the mandibles; postmarginal vein
very long
Malar space wanting, the eyes large and extending to the mandibles; postmarginal vein very
long, the stigmal vein subsessile and usually with a fuscous fascia from apex.
Zaommomyia Ashmead, g. nov. (type Chrysocharis stigmata Ashm.).
10. Wings usually with transverse fasciæ, the postmarginal vein not well developed; head wider than
long; flagellum short, compressed, fusiform, the joints except the last wider than long.
Closterocerus Westwood (type C. trifasciatus Westw.).
11. Antennæ 10-jointed, with one ring-joint
Antennæ 9-jointed, with one ring-joint or less
12. Wings immaculate
Wings maculate.
Antennæ very long, verticillate-pilose, the funicle joints subdentate Astichus Förster.
13. Metanotum short, usually without a median carina
Metanotum not short, tricarinate.
Antennæ filiform
14. Metanotum smooth, impunctate
Metanotum punctate or sculptured.
Wings subglabrous, the faint pubescence arranged in hair-lines; postmarginal vein well devel-
oped, longer than the stigmalSecodes Förster.
15. Front wings finely pubescent; postmarginal vein long, well developed.
Eyes not large, the malar space distinct; scape of antennæ metallicEuderus Haliday.
Eyes very large, occupying the whole sides of the head, the malar space wanting; scape of
anteunæ very slender, whiteEuophthalmomyia Ashmead.
Front wings subglabrous, not well pubescent, the pubescence arranged usually in more or less irregular
hair-lines; postmarginal vein not well developed, rarely longer than the very short stigmal vein.
Head normal, not wider than the thorax; stigmal vein very short, the knob sessile or subsessile;
parapsidal furrows complete; abdomen long
Head very broad, lenticular, wider than the thorax; stigmal vein rather long; parapsidal fur-
rows obliterated anteriorly
16. Antennæ 8-jointed, with one ring-joint
Antennæ 9-jointed, with one ring-joint, the funicle 3-jointed.
Eyes normal, the malar space distinct
Eyes very large, extending to base of mandibles, the malar space wanting.
Zaommomyia Ashmead.
17. Wings with a marginal fringe, often with transverse bands, the stigmal vein clavate, longer than the
postmarginal
Tribe III. Entedonini.
This tribe is easily distinguished from the Omphalini by the distinctly petiolate
abdomen, and from the <i>Pediobiini</i> by the complete parapsidal furrows.
TABLE OF GENERA.
1. Females
Males

2.	Scutellum with lateral longitudinal grooved lines, at the most with a single median furrow 7 Scutellum with lateral longitudinal grooved lines.
	Antennæ 10-jointed, with only one ring-joint, or less than 10-jointed, the ovipositor never promi-
	nent
	Antennæ 10-jointed, with two ring-joints, the ovipositor very long, longer than the abdomen;
	flagellum very long, the funicle 4-jointed, the joints long, swollen at base and tapering off
	at apex, the swollen portion with whorls of long hairs.
	Uroentedon Ashmead, g. nov. (type <i>U. verticellata</i> Ashm.).
4.	Head normal, viewed from in front not or scarcely wider than long; stigmal vein short
	Head abnormal, viewed from in front very short, twice as wide as long or even wider; stigmal vein
	long 5
5.	Eyes pubescent; wings with the disk usually subfuscous, but not banded; antennæ 10-jointed, sub-
	clavate
	Eyes bare; wings with two fuscous transverse bands; antennæ 10-jointed, long, the flagellum long,
	subclavate, the funicle 4-jointed, the joints longer than thick; cylindrical; prothorax conical; parap-
	sides prominently convex
6.	Funicle 3-jointed, the joints cylindrical, slightly pedicellate, the club 4-jointed, black or brown-black,
	not white; metanotum smooth, without a median carina.
	Eulophopteryx Ashmead, g. nov. (type E. chapadæ Ashm.).
	Funicle 3-jointed, the joints compressed, briefly pedicellate, the club 4-jointed, white or yellowish
	white; metanotum with a median carina. Lophocomus Haliday (type Cirrospilus anaitis Walk.).
7	Scutellum without a median longitudinal grooved line
1.	Scutellum with a median longitudinal grooved line.
	Antennæ 10-jointed, with one ring-joint, the flagellum filiform, pubescent, the funicle 4-jointed,
	the joints long, cylindrical; abdomen with a long petiole.
	Holcopeltoideus Ashmead, g. nov. (type Holcopelte petiolata Ashm.).
	Antennæ 9-jointed, with one ring-joint, usually subclavate, the funicle 3-jointed, the joints
	oblong-oval or submoniliform; abdomen with a short petiole.
	Horismenus Walker (type H. cleodora Walk.).
8.	Antennæ 9-jointed, with one ring-joint or less than 9-jointed
	Antennæ 10-jointed, with one ring-joint.
	Metathorax without lateral carine
	Metathorax with lateral carinæ and a median carina, the latter usually forked at apex.
	Body of abdomen ovate, the first segment occupying about one third the whole surface.
	Pleurotropis Förster (type P. isomera Först.).
9.	Metathorax produced into a long neck at apex, with a delicate median carina at base.
	Head very wide, lenticular, much wider than the thorax, concave behind; flagellum filiform,
	the funicle 4-jointed; postmarginal vein not developed; abdomen with a long petiole.
	Pelorotelus Ashmead, g. nov. (type P. cæruleus Ashm.).
10.	Antennæ 8-jointed, with one ring-joint, or less than 8-jointed
	Antennæ 9-jointed, with one ring-joint, the funicle 3-jointed, the club 3-jointed, the last joint usually
	represented by a little spur.
	Metathorax without lateral carinæ.
	Metathorax with lateral carinaMestocharis Förster (type M. cyclopsila Först.).

11	Scutellum not smooth, scaly punctate, or finely reticulately punctate
10	Head very broad, much wider than the thorax, the occiput concave; metanotum with a median carina
12	connected with a transverse carina at apex, the spiracles in depressions, large and oval.
	Entedon Dalman (type E. cyanellus Dalm.).
	Head not so broad, not or scarcely wider than the thorax; metanotum with a delicate median carina
	connected with a transverse carina before the apex, the same a little curved on each side from the
	apex of the median carina, the spiracles small, short oval or roundedDerostenus Westwood
	(type D. gemmeus Westw.).
10	. Antennæ short and strongly clavate, the funicle 2-jointed, the club large, 3-jointed.
10	Funicle joints neither small nor annular, distinctly separated; pedicel not large, much narrower
	than the first joint of funicleRhopalotus Förster (type Elachertus cothurnatus Ratzeb.).
	Funicle joints very minute, annular, and closely united with the club; pedicel large.
14	Chrysoatomus Ashmead, g. nov. (type C. zealandicus Ashm.). Scutellum with two longitudinal grooved lines
	Scutellum without longitudinal grooved lines, or at the most with a median grooved line
15	Antennæ 10-jointed or less, with only one ring-joint
10	Antennæ 10-jointed with two ring joints
10	Head abnormal, viewed from in front, very short and twice as wide as long, or even wider; stigmal
10	vein long
	Head normal, viewed from in front, not or scarcely wider than long
17	Eyes pubescent; wings with a subfuscous discal cloud but not banded; pronotum rounded before. 18
	Eyes bare; wings with two transverse fuscous bands; pronotum conical.
	Antennæ very long, 10-jointed, the joints of the funicle globose at base, longly petiolate at apex,
	with whorls of long hairs on the basal portion; sometimes also with short branches on the
	first three joints of funicle
18	. Antennæ long, 10-jointed, as in Hoplocrepis.
	Metanotum without a median carina
	Metanotum with a median carina
19	Scutellum with a median longitudinal grooved line
	Scutellum without a median longitudinal grooved line
20	. Antennæ 10-jointed, the funiele 4-jointed, the joints rather longer, pedicellate at apex, the club 3-jointed.
	Holcopeltoideus Ashmead.
	Antennæ 9-jointed, the funicle 4-jointed, the joints oval, very briefly pedicellate, the club 2-jointed.
	Horismenus Walker.
21	. Antennæ 9-jointed, with a ring-joint, or less than 9-jointed
	Antennæ 10-jointed, with a ring-joint, the funicle 4-jointed, the joints oblong, very briefly pedicellate,
	or loosely joined, the club 3-jointed, the last joint represented by a little spur.
	Metanotum not short, with lateral carine and a median carina; abdomen short oval, the second
	segment occupying nearly half the whole surface, the following segments after the third very
	shortPleurotropis Förster.
22	. Antennæ 8-jointed or less
	Antennæ 9-jointed.
	Metathorax smooth, without lateral carine
	Metathorax with lateral carinæ, the median carina also usually present.

Flagellum short, stout, subclavate, the funicle 3-jointed, joints 2 and 3 not longer than 23. Scutellum never smooth, always punctate, scaly-punctate or reticulate; metanotum more or less sha-Scutellum always smooth, impunctate; metanotum smooth, not sculptured. Flagellum subfiliform, much stouter than the small pedicel, the funicle 3-jointed, the joints 24. Flagellum filiform, the funicle 3-jointed. Metanotum with a transverse carina at apex; postmarginal vein short...... Entedon Dalman. Metanotum with a tranverse carina a little before the apex; postmarginal vein long. Derostenus Westwood. 25. Antennæ short, strongly clavate, pubescent. Tribe IV. Pediobiini. In this tribe are found some of the smallest members of the subfamily. It is distinguished from the other tribes by having the mesonotal furrows incomplete or wholly wanting, at the most indicated by a slight depression posteriorly, but not by grooved lines. In the other tribes the mesonotal or parapsidal furrows are usually complete and always sharply defined, the mesonotum being distinctly trilobed. All of the species falling in this group, or tribe, are, I think, hyperparasites and attack other members of the Entedonina, as well as members of other groups, and more particularly species in the Eulophina; they are the cannibals of the Eulophida, since they attack and devour almost any member of the family, the species of the genus Eulophus particularly being most frequently devoured by them. TABLE OF GENERA. Abdomen distinctly petiolate. Head lenticular, wider than the thorax; abdomen conically pointed, the second segment large, occupying most of the surface; antennæ 8-jointed (or 9-jointed with a ring-joint), the funicle 3-jointed, the joints oval, loosely joined or subpedunculate; postmarginal vein very short. Paracrias Ashmead, g. nov. (type P. laticeps Ashm.). Ovipositor exserted, the length of the abdomen. Wings with long marginal cilia, the postmarginal vein long, the stigmal vein short; head trans-(type U. pleuralis Ashm.). Wings with short marginal cilia...... 6 5. Marginal vein very long.

Stigmal vein long; antennæ 8-jointed (or 9-jointed	with a riug-joint), the funicle 3-jointed, the
joints longer than thick	Chrysonotomyia Ashmead, g. nov.
	(type Eulophus auripunctatus Ashm.).

Stigmal vein short; antenue 9-jointed, with a ring-joint, the flagellum filiform, tapering off at apex, and furnished with long, sparse hairs, the funicle 3-jointed; abdomen long, conic-ovate.

Ametallon Ashmead, g. nov. (type A. chapadæ Ashm.).

6. Antennæ 7-jointed (or 8-jointed with a ring-joint), if 9-jointed the head not especially large 7 Antennæ 8-jointed (or 9-jointed with a ring-joint); head large, wider than the thorax.

Flagellum slender, filiform, clothed with some long, sparse hairs, the funicle and club each 3jointed; head large, much wider than the thorax; wings with one or two fuscous fasciæ; abdomen conic-ovate, the second segment occupying scarcely half the whole surface.

Acrias Walker (type A. nileus Walker).

7. Stigmal vein usually very short, the knob sessile or subsessile.

Thorax and scutellum smooth, impunctate; antennæ 8-jointed, with a ring-joint, not tapering toward apex, the joints of the funicle submoniliform.

Pediobius Walker (type Entedon cædicius Walk.).

Thorax and scutellum with a scaly punctation; antennæ 9-jointed with a ring-joint, tapering off at apex, the joints of the funicle not submoniliform.

Nesomyia Ashmead, g. nov. (type N. albipes Ashm.).

Abdomen distinctly petiolate.

9. Wings with short marginal cilia..... 10

Wings with long marginal cilia.

Stigmal vein short.

SUBFAMILY II. APHELININÆ.

- 1856. Myinoidæ, Familie, 3, Förster, Hym. Stud., II., pp. 18, 21 and 30.
- 1875. Aphelinina, Tribus, Thomson, Hym. Skand., IV., pp. 12, 183.
- 1886. Aphelininæ, Subfamily, Howard, Ent. Amer., I., p. 198.
- 1897. Aphelininæ, Subfamily, II., Ashmead, Proc. Ent. Soc. Washington, IV., p. 236.

Many authorities have treated this group as allied to the *Encyrtida*, and usually place it next to that family, with which it has no affinity whatever. It is clearly a component of the Eulophida, where Dalman first placed it, as is shown by the structural characters of the mesothorax.

An excellent reversion of the group has been given by Dr. L. O. Howard, in Technical Series No. 1. U. S. Department of Agriculture, where most of the genera have been fully described and figured.

TABLE OF TRIBES. Tarsi 5-jointed......Tribe I. Aphelinini. TRIBE I. Aphelinini. The five-jointed tarsi distinguish the tribe. The majority of the species confine their attacks to various genera of scale-insects, or bark-lice, belonging to the family Coccidæ. A few, however, in the genus Aphelinus, while usually bred from Coccidæ, also attack plant-lice belonging to the family Aphididæ. All the species, except probably the latter, which may be hyperparasitic on some Encyrting, are supposed to be primary parasites, and are of the greatest importance in destroying the destructive bark-lice (Coccidæ). TABLE OF GENERA. Winged. Front wings with a hairless oblique line extending from the marginal vein towards the base of Front wings without such a line. Antennæ 8-jointed...... 3 3. Club of antennæ 3-jointed. 4 5. Stigmal vein short but distinct, always present. Marginal vein much shorter than the subcostal vein. Prospalta Howard (type P. murtfeldti How.). 6. Flagellum strongly compressed, the first joint of the funicle about twice as long as the pedicel, the following shortening; hind tibiæ flat, with short stiff bristles behind. Aneristus Howard (type A. ceroplastæ How.). Flagellum not compressed, subcylindrical, the first joint of funicle not twice as long as the pedicel. hind tibiæ normal, without short, stiff bristles behind. Coccophagus Westwood (type C. pulchellus Westw.). 9. Abdomen, seen from above, short, oval, depressed, beneath boat-shaped or carinate; hind tibiæ nor-Abdomen, seen from above, subovate, flat, beneath subconvex; hind tibiæ behind armed with stiff 10. Abdomen short, depressed, not boat-shaped beneath, ending in a prominent ovipositor.

Ablerus Howard (type Centrobia clisiocampæ Ashm.).

11.	Front wings with long marginal cilia, dusky on basal half; club, or terminal joint of the 3-jointed antennæ, very long
12.	Antennæ 6-jointed. 13 Antennæ 5-jointed. 17
12	Antennæ with the three joints before the club unequal in length
10.	Antennæ with the three joints before the club equal in length
14	Ovipositor prominently exserted
11.	Ovipositor not at all, or at most only slightly, exserted; wings hyaline
	(type Entedon abdominalis Dalm.).
15.	Wings not wholly hyaline, maculate, or with rounded fuscous spots
	Wings hyaline; with a brown band; post-scutellum abnormal, extending to the base of the abdomen;
	ovipositor prominent, \(\frac{1}{3}\) the length of the abdomen Centrodora Förster (type C. amæna Först.).
16.	Wings hyaline, with rounded, fuscous spots Marietta Motschulsky (type M. leopardina Motsch.).
	Wings strongly maculate, with broad irregular fuscous bands and spots of a peculiar pattern.
	Perissopterus Howard (type Aphelinus pulchellus How.).
17.	Ovipositor exserted; mandibles 3-dentate Physcus Howard (type Coccophagus rarieornis How.).
18.	Antennæ 6-jointed
19.	Front wings with a hairless oblique line; antennæ 5- or 6-jointed
	Front wings without such a line.
	Antennæ 8-jointed
	Antennæ 3-jointed.
	Wings with long marginal cilia
20.	Front wings with the marginal cilia short
	Front wings with the marginal cilia long
21.	Marginal vein much shorter than the subcostal vein
	Marginal vein as long as or longer than the subcostal vein
22.	Hind tibiæ not armed with stiff bristles behind
0.0	Hind tibiæ armed with stiff bristles behind
23.	Front wings broadly rounded at apex, the stigmal vein present
0.4	Front wings narrowed and pointed at apex, the stigmal vein absentAspidiotiphagus Howard.
24.	Unknown Ablerus Howard.
95	Antennæ 6-jointed
20.	Antennæ 5-jointed.
26	Antennæ s-jointed. Antennæ with the three joints before the club of an unequal length
20.	Antennæ with the three joints before the club of an equal length
27.	Wings not wholly hyaline
	Wings wholly hyaline
28.	Wings with rounded fuscous spots or strongly maculate with fuscous bands and irregular spots 29
	Wings hyaline except a fuscous band
29.	Wings with rounded fuscous spots
	Wings strongly maculate with broad irregular fuscous bands and spots of a peculiar pattern.
	Perissopterus Howard.

Tribe II. Pteroptricini.

This tribe is separated from the former by having 4-jointed tarsi, not five. It forms a transition, or a connecting link, between the subfamilies *Aphelininæ* and the *Tetrastechinæ*, some of its members are easily mistaken for some of those of the latter.

The very short, or nearly obsolete, stigmal vein, and the absence of the mesosternal furrow, will, however, readily distinguish them.

The species attack principally the mealy-winged plant-lice, family Aleurodidæ.

TABLE OF GENERA.

1.	Females
	Males
2.	Antennæ 8 jointed, normal, the last joint very short. Pteroptrix Westwood (type P. dimidiata Westw.).
	Antennæ 5-jointed, with 2 minute ring-joints, the last joint, or the club, greatly lengthened.
	Eretmocera Haldeman (type E. corni Haldeman.).
3.	Antennæ 8-jointed
	Antennæ 3-jointed (or 4-jointed with a ring-joint), the last joint very long. Eretmocera Haldeman.

SUBFAMILY III. TETRASTICHINÆ.

- 1856. Tetrastichoidæ, Familie 21, Förster, Hym. Stud., II., pp. 26 and 83.
- 1878. Tetrastichina, Tribus, Thomson, Hym. Skand., V., p. 180.
- 1886. Tetrastichinæ, Subfamily, Howard, Ent. Amer., I., p. 199; II., p. 98.
- 1897. Tetrastichinæ, Subfamily III., Ashmead, Proc. Ent. Soc. Washington, IV., p. 249.

This subfamily is closely allied to the *Aphelinine*, and some of the smaller species falling in it, are easily confused with many in the *Aphelinini*, if attention is not given to the difference in the length of the stigmal vein.

TABLE OF TRIBES.

Abdomen distinctly petiolate; hind wings with a long, clavate marginal vein......Tribe I. Ceratoneurini. Abdomen sessile or subsessile; hind wings with a slender marginal vein........Tribe II. Tetrastichini.

Tribe I. Ceratoneurini.

The distinctly petiolate abdomen, and the long clavate marginal vein in the hind wings, found in no other tribe, will distinguish the tribe at a glance.

Only one genus is known:

Antennæ 10-jointed, with two ring-joints; face with striæ converging towards the mouth.

Ceratoneura Ashmead (type C. petiolata Ashm.).

Tribe II. Tetrastichini.

The sessile or subsessile abdomen, and the difference in the venation of the hind wings separate this tribe from the *Ceratoneurini*. The scutellum has usually *four*

longitudinal grooved lines, rarely five, but never less than two longitudinal grooved lines.

The species falling in this group are not restricted in their habits, but attack nearly all orders of insects. They have been bred, according to the records, from the larvæ of Coleoptera, Lepidoptera, Hymenoptera, Diptera, Orthoptera, Neuroptera, Odonata, etc., and appear to be both primary and secondary parasites.

The vast majority of them, however, appear to be primary parasites upon the gall-making or gall-inhabiting insects in the Orders Diptera, Hymenoptera and Coleoptera.

The curious, and in some respects anomalous, genus *Melittobia* Westwood is parasitic in the nests of bees and wasps, and is said to attack not only these insects but also other hymenopterous parasites of the bees and the wasps, *i. e., Monodontomerus*, etc. In this country species have been bred from the nests of bees and wasps, just as in Europe, but here we have *positive* evidence that they came from the puparium of a Dipteron, and I have, therefore, my doubts as to the genus being a primary parasite of bees and wasps.

TABLE OF GENERA.

1.	Females
	Males
2.	Mesonotum without a median grooved line
	Mesonotum with a median grooved line
3.	Pronotum transverse, not conical, or subquadrate or rounded anteriorly4
	Pronotum long, conical.
	Antennæ 9-jointed, inserted near the mouth border; abdomen longer than the head and thorax
	united, subcompressed, the ventral valve prominent
	(type Cirrospilus acasta Walk.).
4.	Antennæ 9-jointed, with one ring-joint
	Antennæ 10-jointed, with two ring-joints.
	Abdomen very long, conically produced, two or more times longer than head and thorax
	united
	Abdomen not long, either ovate or conic-ovate and not or rarely much longer than the head
	and thorax united.
	Abdomen above depressed or concave, never cylindrical, either carinate or convex be
	neath, polished, the segments not subequal
	(type T. floridanus Ashm.).
	Abdomen cylindrical, convex above, never depressed, shagreened or punctate, never
	smooth, the segments subequal; funicle joints cylindrical, at least twice as long as
	thick
5.	${\bf Metanotum\ usually\ very\ short,\ with\ a\ \Lambda-shaped\ median\ carina,\ each\ fork\ diverging\ towards\ the\ lateral}$
	hiud angle, more rarely with a straight median carina
	(type Eulophus elongatus Förster).

6.	Scutellum with two longitudinal grooved lines; hind wings acutely pointed; front wings with a long marginal fringe
	Scutellum with four longitudinal grooved lines; hind wings not acutely pointed.
	Head and thorax smooth or nearly, at the most only sparsely punctate, metanotum smooth,
	with a delicate median carina; abdomen rotund or broadly oval, shorter than the thorax but
	wider Syntomosphyrum Förster (type Eulophus cyclogaster Ratz.).
	Head and thorax shagreened or punctate, as well as the abdomen; metanotum punctate;
	abdomen rather long, cylindrical, the segments subequal Trichoporus Förster (partim).
7.	Scape of antennæ normal, neither greatly thickened nor dilated
	Scape of antennæ abnormal, enormously enlarged, or dilated; antennæ 9-jointed with one ring-joint,
	the funicle 4-jointed.
	Front wings with a long marginal fringe; funicle joints short, moniliform Ceranisus Walker
	(type C. pacuvius Walk.).
	Front wings with a short marginal fringe; funicle joints longer than thick. Baryscapus Förster
	(type unknown).
8.	Antennæ 10-jointed, with two ring-joints, the funicle 3-jointed, the club ovate, 3-jointed
	Antennæ 9-jointed, with one ring-joint, or less than 9-jointed
9.	Abdomen ovate or conic-ovate, rarely, although sometimes, greatly lengthened and conically produced
	as in Hyperteles
10.	Antennæ 9-jointed, with one ring-joint
	Antennæ 8-jointed, with one ring-joint
11.	Front legs normal, the tibiæ and tarsi long and slender; pronotum not long, rounded before, hardly
	half the length of the mesonotum; abdomen much elongate, conically produced, subcompressed, with
	usually a prominent ovipositor; funicle joints much longer than thickAprostocerus Westwood
	(type A. caudatus Westw.).
	Front legs abnormal, much swollen, the tibiæ short and thick; pronotum large, transverse quadrate,
	nearly as long as the mesonotum, the front angles a little rounded; body of abdomen oblong, de-
	pressed, not longer than the head and thorax united, the ovipositor prominent but not longer than
	half the length of the abdomen; funicle joints short, not longer than thick, sometimes a little wider
	than long
12.	Abdomen ovate, the ovipositor hidden.
	Autennæ very short, clavate, the pedicel obconic, thicker and longer than the first two joints
	of the funicle united, which are small, quadrate; wings with a long marginal fringe.
	Pentastichus Ashmead (type P. xanthopus Ashm.).
13.	Mesonotum without a median grooved line
	Mesonotum with a median grooved line
14.	Species fully winged
	Apterous or subapterous.
	Pronotum long, conical; antennæ 9-jointed, inserted close to the mouth, the scape long,
	broadly dilated towards apex, the pedicel and first funicle joint dilated, the funicle
	joints 2-4 small, transverse, the club ovate, 3-jointed
15.	Antennæ 9-jointed with one ring-joint
	Antennæ 8-jointed or less
16.	Front wings with a short marginal fringe, the hind wings not acutely pointed at apex
	Front wings with a long marginal fringe, the hind wings acutely pointed at apex. Gyrolasia Förster.

17. Abdomen short oval, or rotund, shorter than the thorax
Abdomen elongate, conic-ovate or conical, fully as long as, or longer than, the thorax.
Metanotum not punctate, the abdomen neither cylindrical nor sculptured, the segments not
subequal, the head and thorax smooth, not strongly sculptured or closely punctate 18
Metanotum very short and punctate, the abdomen cylindrical, sculptured, the segments short,
subequal, the head and thorax closely punctate or strongly sculpturedTrichoporus Förster.
18. Metanotum very short, smooth, and often without a median carina; if the median carina is present it
is united with a transverse apical carina; abdomen not longer than the thorax.
Tetrastichodes Ashmead.
Metanotum short, with a Λ-shaped median carina; abdomen very long, conically produced, much
longer than the thorax
19. Species small and short, black or at most æneous black, the abdomen rotund, never ovate or conically
pointed
20. Antennæ 8-jointed, without a ring-joint.
Abdomen ovate or conically pointed. Abdomen short rotund
Abdomen not short, ovate, or conic ovate
21. Scape of antennæ normal, neither greatly thickened nor dilated
Scape of antennæ enormously enlarged or dilated.
Front wings with a long marginal fringe; flagellum filiform, slender, with a short pubescence.
Ceranisus Walker.

22. Antennæ 9-jointed, with one ring-joint

Walker changed it to *Elachestus* which held sway until 1856, when Förster changed it to *Elachistus*, making it the type of his family *Elachistoidæ*. I restore the original spelling of the genus and call the subfamily *Elachertinæ*. The continual change in

the spelling of long-established genera is most annoying, confusing and difficult to follow and I hold, with many other zoölogists, that the only way to free ourselves from these perplexities is to adhere strictly to the original spelling and to treat all genera incorrectly formed as mere combinations of letters without special significance. In no other way can we secure permanency in nomenclature.

All the species falling in this subfamily are apparently parasitic only upon the larvæ of Lepidoptera, and more especially upon various families in the suborder Heterocera, particularly those belonging to the families *Bombycida*, *Noctuida*, *Geometrida* and *Tortricida*.

Four minor groups, or tribes, have been recognized, distinguished by the number and length of the hind tibial spurs.

TABLE OF TRIBES.

1.	Hind tibiæ with only one apical spur
	Hind tibiæ with two apical spurs.
	Hind tibial spurs very long; pronotum anteriorly acute
	Hind tibial spurs normal, never very long; pronotum anteriorly roundedTribe II. Ophelinini.
2.	Hind tibial spur normal, rarely very long

Tribe I. Euplectrini.

This tribe is easily separated from the others by the two very long apical spurs of the hind tibiæ, the inner spur being very nearly as long as the basal joint of the tarsi.

Although parasitic upon lepidopterous larvæ, like the other tribes, it differs widely from the others, whose habits are known, in that the larvæ are either external feeders, or on reaching maturity, gnaw their way out of their host and spin small silk cocoons, like some of the *Braconidæ*, within which they pupate and undergo their final transformation. All of the others either pupate as naked pupæ, without a cocoon, within the body of their hosts, or emerge and attach themselves to the under or upper side of a leaf, or else conceal themselves in some convenient crevice or under loose bark.

TABLE OF GENERA.

1.	remaies
	Males 3
2.	Scape in both sexes normal, slender; postmarginal vein distinctly longer than the stigmal vein.
	Euplectrus Westwood (type Pteromalus bicolor Swederus).
	Scape in male abnormally enlarged, swollen; postmarginal vein not longer than the stigmal.
	Pachyscapha Howard (type P. insularis How.).
3.	. Scape of antennæ normal Euplectrus Westwood.
	Scape of antennæ enormously enlarged

Tribe II. Ophelinini.

The much shorter hind tibial spurs separate this tribe from the *Euplectrini*. The pronotum is also different, more rounded anteriorly, and the hind coxe are not so much swollen.

It is difficult sometimes to tell whether or not the abdomen is petiolate or sessile, and in two or three cases I have been compelled to put certain genera in both categories, the petiole being so short as to give the abdomen the appearance of being sessile.

565	TABLE OF GENERA.
1.	Females
	Males
2	Abdomen distinctly petiolate.
	Abdomen sessile or subsessile
3	Scutellum with two dorsal grooved lines.
•	Scutellum without dorsal grooved lines.
4.	Body metallic
	Body not metallic
5.	Eyes bare, not pubescent.
	Eyes pubescent; antennæ 9-jointed
6.	Abdomen ovate or oblong-oval, shorter than the thorax
	Abdomen conic-ovate, not shorter than the thorax, the second segment large; funicle 4-jointed, the
	joints cylindrical, longer than thick; metathorax produced into a subglobose neck.
	Scutellum with a median grooved line; mesothoracic furrows distinct.
	Diglyphomorpha Ashmead, g. nov. (type Diglyphus maculipennis Ashm.)
	Scutellum without a median grooved line; mesothoracic furrows very delicate although complete
	appearing incomplete without the aid of a strong lensArdalus Howard
	(type A. aciculatus How.)
7.	$ Antennæ \ 9\text{-jointed}, \ the \ funicle \ 4\text{-jointed}, \ subcompressed, \ joints \ 3-4 \ wider \ than \ long \ ; \ scutellum \ without \ an \ long \ ; \ scutellum \ without \ long \ ; \ scutellum \ long \ ; \ scutellum \ without \ long \ ; \ scutellum \ long \ scutellum \ long \ ; \ scutellum \ long \ ; \ scutellum \ long \ ; \ scutellum \ long \ scutellum \ long \ scutellum \ long \ scutellum \ long \ l$
	grooved linesLeucodesmia Howard (type L. typica Howard).
	Antennæ 10-jointed, the funicle joints longer than wide.
	Scutellum with 2 dorsal grooved linesElachertomorpha Ashmead, g. nov.
	(type E. flaviceps Ashm.)
8.	Antennæ 10-jointed, the funicle 4 jointed, the joints loosely joined; abdomen globose, the petiole long
	slender; scutellum with two grooved lines
	Antennæ 10-jointed, with one ring-joint
9.	Antennæ 9-jointed with two ring-joints
	Antennæ 9-jointed, with one ring-joint; the funicle 4-jointed, eyes pubescent; funicle joints compressed
	joints 3-4 wider than long; abdomen oval or ovate, shorter than the thoraxLeucodesmia Howard
10	(type L. typica How.).
10.	Antennæ 9-jointed.
	Pronotum campanulate; pedicel long, obconic. Miotropis Thomson (type M. sulcicris Thomso.).
10 :	Pronotum quadrate; pedicel not longDichotomus Förster (type D. acerinus Först.). *Body of abdomen ovate as long or longer than the thorax, the petiole very short.
10	Sympiesomorpha Ashmead, g. nov. (type S. brasiliensis Ashm.).
	manufacture restricted, g. nov. (b) pe b. or dettends Ashm. J.

	Body of abdomen subglobose or ovate, much shorter than the thorax, the petiole usually long.
	Stenomesius Westwood (type Ichneumon rufescens Rossi).
11.	Scutellum with two dorsal grooved lines
	Scutellum without dorsal grooved lines
12.	Antennæ 9-jointed.
	Metallic; scutellum with a median grooved line; eyes pubescent.
	Diglyphomorpha Ashmead (partim).
	Antennæ 10-jointed, with one ring-joint, the funicle 4-jointed, the club 3-jointed.
	Non-metallic; metathorax with a median carina; marginal vein as long as or a little longer than
	the submarginal, the stigmal vein only about one third the length of the marginal.
	Alophus Ashmead, g. nov. (type A. flavus Ashm.).
	Antennæ 10-jointed, with one ring-joint, the club not thickened, tibial spurs short.
	Sympiesomorpha Ashmead, g. nov. (type S. brasiliensis Ashm.).
13.	Antennæ 9-jointed, with one ring-joint, the club thickened, 3-jointed; tibial spurs long.
	Ophelinus Haliday (type Eulophus ursidius Walk.).
14.	Abdomen distinctly petiolate
	Abdomen sessile or subsessile
15.	Scutellum with two dorsal grooved lines
	Scutellum without dorsal grooved lines
16.	Body metallic
	Body not metallic
17.	Eyes bare, not pubescent
	Eyes pubescent.
	Antennæ, 9-jointed with one ring-joint
10	Antennæ 8-jointed, with one ring-joint.
18.	Scutellum with a median grooved line; mesothoracic furrows very distinct. Diglyphomorpha Ashm.
# 0	Scutellum without a median grooved line; mesothoracic furrows very delicate Ardalus Howard.
19.	Antennæ 9-jointed, with one ring-joint, the funicle 4-jointed, the club ovate, 2-jointed, the flagellum
00	compressed, the joints of the funicle excised at apex aboveLeucodesmia Howard.
20.	Antennæ 10-jointed, with 1 ring-joint, the funicle 4-jointed, the club 3-jointed, the funicle with 3
01	branches
21.	Antennæ 9-jointed, with two ring-joints. Pronotum campanulate
	Prouotum quadrate
99	Scutellum with 2 dorsal grooved lines.
22.	Scutellum without dorsal grooved lines
22	Antennæ 10-jointed, with one ring-joint, the funicle 4-jointed, the club 3-jointed
.20.	Antennæ 9-jointed, with one ring-joint, the funicle 3-jointed.
	Metallic; scutellum with a median grooved line
24	Non-metallic.
_1.	Abdomen with a very short petiole
	Abdomen with a long petiole
25.	Antennæ 9-jointedOphelinus Haliday.
	-

Tribe III. Elachertini.

This tribe may be at once recognized from the two tribes previously defined by the hind tibiæ having only one apical spur; otherwise it is scarcely distinguishable from the *Ophelinini*, many genera falling in it being easily confused with some in that tribe.

6.	Head, viewed from in front, wider than long and not especially thin antero-posteriorly 7		
	Head, viewed from in front, much longer than wide, and very thin antero-posteriorly		
7.	Body not metallic, the head and thorax marked with yellow.		
	Antennæ 9-jointed, with one ring-joint, the pedicel much longer than wide, the funicle 3-jointed,		
	subcompressed, the club 3-jointedCirrospilus Westwood (type C. elegantissimus Westw.).		
	Antennæ 10-jointed, with one ring-joint, the pedicel short, only a little longer than thick, the		
	funicle 4-jointed, the club 3-jointed		
	(type Miotropis platynotæ Howard).		
	Body metallic; antennæ 10-jointed, with one ring-joint, the pedicel longer than wide, the funicle 4-		
	jointed, joints 2-4 not longer than thick		
8.	Antennæ 8-jointed, without a ring-joint or 9-jointed with a ring-joint, the pedicel not much longer than		
	wide, the flagellum subcompressed; body striped or banded with black lines; wings banded or macu-		
	lateZagrammosoma Ashmead n. n. (type Hippocephalus multilineata Ashm.).		
9.	Antennæ 8-jointed or less		
	Antennæ 9-jointed or more		
10.	Funicle 3-jointed, the club 3-jointed		
	Funicle 2-jointed, the joints subpedunculate, the club ovate, 3-jointed.		
	Middle lobe of the mesonotum longer than wide; metathorax very short, the apical lateral		
	angles subacute; abdomen oblong-oval, depressedScotolinx Ashmead, gen. nov.		
	(type S. gallicola Ashm.).		
11.	Mesonotum a little longer than wide; abdomen conic-ovate		
	(type Ichneumon gallarum L.).		
	Mesonotum a little wider than long; abdomen oval or ovate		
	(type P. lineatifrons Ashm.).		
12.	Antennæ 10-jointed, with one ring-joint		

	Antennæ 9-jointed, with one ring-joint.
	Non-metallic, usually yellowish, or the thorax more or less yellow; scutellum with 4 bristles;
	pronotum campanulate; abdomen ovate or conic-ovateCirrospilus Westwood (partim).
13.	Metallic in part; mesonotum not longer than the scutellum; abdomen broadly rounded, depressed,
	and a little shorter than the thorax
	Non-metallic; mesonotum long; abdomen elongate oval or ovate, usually pointed at apex and longer
	than the thorax Stenomesioidea Ashmead, g. nov. (type S. mellea Ashm.).
14.	Abdomen distinctly petiolate
	Abdomen sessile or subsessile
15	Scutellum with two dorsal grooved lines.
10.	Body neither metallic nor wholly black
	Body metallic or wholly black.
	Antennæ 10-jointed, with one ring-joint
16	Antennæ 10-jointed, with one ring-joint. Cirrospiloideus Ashmead.
	Scutellum with two dorsal grooved lines
11.	Scutellum with two dorsal grooved lines.
10	Head normal, viewed from in front wider than long or rounded, not especially thin antero-pos-
18.	
	teriorly
10	Head abnormal, viewed from in front much longer than wide and very thin antero-posteriorly 20
19.	Body not wholly metallic, the head and thorax marked with yellow.
	Antennæ 9-jointed, with one ring-joint
	Antennæ 10-jointed, with one ring-joint
2.0	Body metallic; antennæ 10-jointed, with one ring-joint, the funicle 4-jointedElachertus Spinola.
20.	Antennæ 9-jointed with a ring-joint, body striped or banded with black lines; wings banded or macu-
0.1	lateZagrammosoma Ashmead.
21.	Antennæ 8-jointed or less
	Antennæ 9-jointed or more
22.	Funicle 3-jointed
	Funicle 2-jointed
23.	Mesonotum longer than wide
	Mesonotum a little wider than long
24.	Antennæ 10-jointed, with one ring-joint.
	Non-metallic(?) genus.
	Antennæ 9-jointed, with one ring-joint.
	Metallic
	Non-metallic
	Subfamily V. Eulophinæ.
1.01	
	56. Eulophoidæ, Familie 19 (partim), Förster, Hym. Stud., II., pp. 19, 26 and 74.
18'	75. Eulophina, Tribus (partim), Thomson, Hym. Skand., V., p. 180.
188	86. Eulophinæ, subfamily (partim), Howard, Ent. Amer., I., p. 198; II., p. 99.
	To this subfamily are restricted all Eulophids having the mesonotum entire or
	ly partially divided, the mesonotal furrows being at the most only indicated an-
ter	iorly; otherwise it resembles the others.

The species are parasites of the Micro-lepidoptera, and particularly the leafminers, although other groups are also attacked by them. Some are also said to be hyperparasites of other Chalcidoids.

Most of the species are very small, of brilliant metallic colors, and the antennæ in many males are ramose or branched.

Two tribes have been recognized:

TABLE OF TRIBES.

TRIBE I. Eulophini.

In having two apical spurs to the hind tibie this tribe agrees with the Euplectrini and the Ophelinini, in the subfamily Elachertinæ, but it cannot possibly be confused with these tribes, if attention is given to the difference pointed out in the mesonotum, the mesonotal furrows being incomplete.

TABLE OF GENERA.

1. Females	 	2
Males	 1	11
2. Scutellum with two dorsal grooved lines	 	3
Scutellum without dorsal grooved lines	 	4
3. Antennæ inserted below the middle of the face.		

Head seen from in front longer than wide, or as long as wide; stigmal vein about half the length of the marginal vein; pronotum short, rounded anteriorly; abdomen ovate, depressed above; antennæ 8-jointed, with one ring-joint, the funicle two-jointed, the club long, 3-jointed.

Diaulus Ashmead, g. nov. (type D. begini Ashm.).

Head seen from in front twice wider than long or nearly; stigmal vein long, nearly two thirds the length of the marginal vein; pronotum semicircular, not short, narrower than the mesonotum; abdomen ovate, depressed above, hardly as long as the thorax; antennæ 9-jointed, the flagellum subclavate, the funicle four-jointed...... Diaulomorpha Ashmead, g. nov.

(type D. australiensis Ashm.).

- 5. Thorax long, the pronotum long, conical and much narrower than the mesonotum, but fully as long; head wide, as wide as the thorax, seen from in front a little wider than long; antennæ 10-jointed, with one ring-joint, inserted a little below the middle of the face, the funicle 4-jointed, the joints long, the first much the longest, twice as long as the third, the fourth hardly longer than thick; wings with a discoidal cloud beneath the stigmal vein, the marginal vein very long, more than thrice
- Marginal vein shorter, not thrice as long as the stigmal vein, usually only about twice as long..... 8
- 7. Antennæ 10-jointed, the flagellum more or less compressed, the joints long, the first joint of the funicle

	much the longest joint; metathoracie spiracles oblong-oval; abdomen often very long, conically pointed, much longer than the head and thorax united
	Antennæ 10-jointed, with one ring-joint, the flagellum not compressed, the funicle joints cylindrical;
	metathoracic spiracles minute, rounded; abdomen ovate or oval, depressed, not as long as the head
	and thorax united
-	
8.	Thorax not robust
	Thorax robust.
	Metathorax with a median carina, the spiracles small, rounded; antennæ 9-jointed, with one ring-
	joint, the funicle 3-jointed, the club 3-jointed, abdomen oval or subrotund, depressed, usually
	shorter than the thorax
9.	Wings hyaline, the flagellum not compressed
	Wings dusky, the flagellum compressed, the funicle very short; metanotum with a median carina. Microplectron Thomson (type Entedon fascipennis Zeterstd.).
10.	Antennæ 9-jointed (scape pedicel, one ring-joint, 3-jointed funicle and a 3-jointed club).
	Funicle black; metanotum with a distinct median carina, the lateral folds usually present.
	Eulophus Geoffroy (type Ichneumon pectinicornis L.).
	Funicle white; metanotum with a delicate median carina, the lateral folds always absent.
	Microlycus Thomson (type M. heterocerus Thoms.).
11.	Scutellum with dorsal grooved lines
	Scutellum without dorsal grooved lines
12.	Thorax not long, the pronotum anteriorly rounded; antennæ inserted below the middle of the face, the
	flagellum without branches, filiform.
	Stigmal vein not more than half the length of the marginal vein; antennæ 8-jointed.
	Diaulus Ashmead.
	Stigmal vein longer, at least two thirds the length of the marginal vein; antennæ 9-jointed.
	Diaulomorpha Ashmead.
13.	Thorax not long, the pronotum of normal length
	Thorax long, the pronotum long, conical and much narrower than the mesonotum; antennæ 10-jointed,
	with one ring-joint
14.	Marginal vein very long, three or more times longer than the stigmal vein
	Marginal vein shorter, not thrice as long as the stigmal vein
15.	Antennæ 10-jointed, with one ring-joint.
	Flagellum compressed or subcompressed; metathoracic spiracles oval or subovate; abdomen long.
	Symplesis Förster.
	Flagellum filiform, cylindrical; metathoracic spiracles small, round; abdomen oval.
	Dimmockia Ashmead.
16	Thorax not robust
10.	Thorax robust.
	Metanotum with a median carina and lateral folds; antennæ 9-jointed with 3 long branches.
	Cratotrechus Thomson.
17	Wings clear hyaline; flagellum not compressed
17.	Wings dusky; flagellum compressed; funicle with 3 short branches
10	
10.	Funicle with 3 long branches. Eulophus Geoffroy. Funicle with 3 long branches. Eulophus Geoffroy.
	Funicle with 3 short branches
	¹ Named in honor of Dr. Geo. Dimmock.

Funicle with 2 long branches	.Dicladocerus	Westwood.
Funicle with 5 long branches	Pentacladia	Westwood.

Tribe II. Hemiptarsenini.

The single-spurred hind tibiæ distinguish the tribe; otherwise it is not distinguishable from the preceding tribe.

The genera are not numerous and may be easily recognized by the characters made use of in the following table:

TABLE OF GENERA.

1	Females 2
	Males, 5
2	Scutellum without dorsal grooved lines 3
	Scutellum with 2 dorsal grooved lines.
	Antennæ 8-jointed (scape, pedicel, one ring-joint, 2-jointed funicle and a 3-jointed club).
	Diglyphus Walker = Solenotus Först. (type D. poppæa Walk.).
3.	Antennæ inserted below the middle of the face 4
	Antennæ inserted on the middle of the face.
	Antennæ 9-jointed (scape, pedicel, one ring-joint, 3-jointed funicle and 3-jointed club), the scape
	long, extended beyond the ocelli Hemiptarsenus Westwood (type H. fulvicollis Westw.).
4	Antennæ 9-jointed with 1 ring-joint, the funicle 3-jointed, cylindrical, the first joint the longest, the
	club 3-jointed
5	. Scutellum without dorsal grooved lines
	Scutellum with 2 dorsal grooved lines.
	Antennæ 8-jointed, with a ring-joint
6.	Antennæ inserted below the middle of the face, the scape not extending beyond the ocelli
	Antennæ inserted on the middle of the face, the scape long, extending beyond the ocelli.
	Hemiptarsenus Westwood.
7	Antennæ 9-jointed, the first three joints of the funicle with a long branch Necremnus Thomson.

FAMILY LXXII. TRICHOGRAMMIDÆ.

1846. Eulophidæ, Family II. (partim), Walker, List Chalc. Brit. Museum, I., p. 62.

1856. Trichogrammatoidæ, Family XXII., Förster, Hym. Stud., II., pp. 20, 26 and 87.

1897. Trichogrammatinæ, Underfam., Aurivillius, Entom. Tidsk., 18, p. 250.

Dr. Arnold Förster was the first to recognize this natural family, which is at once distinguished, from all other groups, by the tarsi being 3-jointed, never more nor less.

It comes nearest to the Family *Eulophinæ*, where Westwood placed his genus *Trichogramma* in 1840, and apparently forms a connecting link between that family and the next, or the *Mymaridæ*.

In habits the group agrees with the Mymaridæ, all the species falling in it being egg-parasites.

Two subfamilies have been recognized:

TABLE OF SUBFAMILIES.

Wings without regular rows of hairs	Subfamily I. Oligositinæ.
Wings with regular rows of hairs	Subfamily II. TRICHOGRAMMINÆ.

SUBFAMILY I. OLIGOSITINÆ.

In the arrangement of the pubescence of the wings this group resembles most closely the *Eulophinæ*, and many of the species, but for the 3-jointed tarsi, could be easily mistaken for species in that family.

Only five genera have been described, but it is probable that very many more exist and will be discovered when more attention is given to rearing the egg-parasites of the different orders of insects.

		TABLE OF GENERA.
	1.	Females 2
		Males 6
5	2.	Antennæ 6- or 7-jointed with one ring-joint
		Antennæ 8-jointed with one ring-joint, the funicle 2-jointed Asynacta Förster (type unknown).
6	3.	Antennæ 6-jointed
		Antennæ 7-jointed, with a ring-joint.
		Ovipositor not prominent
		Ovipositor prominent, at least half the length of the long abdomen; eyes oval; pedicel obconi-
		cal, more than twice longer than thick; flagellum fusiform, 4-jointed, the single funicle joint
		hardly separable from the club; wings rather narrow with a long marginal fringe.
		Prestwichia Lubbock (type P. aquatica Lubbock).
4	4.	Funicle 1-jointed, the club 3-jointed.
		Front wings narrow, with a long marginal fringe.
		Front wings without a substigmal fascia; scape straight or clavate, the single funicle
		joint scarcely longer than thick; eyes oblong-oval; metanotum smooth, without a
		carinaOligosita Haliday (type O. collina Hal. (Walker).
		Front wings with a substigmal fascia; scape subclavate, arcuate, the single funicle-joint
		much longer than thick; eyes rounded; metanotum bicarinate.
		Westwoodella Ashmead, g. nov. (type Oligosita subfasciata Westw.).
		Front wings broad, with a short marginal fringe Brachista Haliday (type unknown).
		? new genus.
(6.	Antennæ 7-jointed or less, with one ring-joint
		Antennæ 8-jointed, with one ring-joint
	7.	Fully winged
		Wingless or subapterous.
		Scape slender, pedicel obconical, about thrice as long as thick at apex, the flagellum fusiform

4-jointed, the single funicle joint hardly separable from the club, hind legs very long. Prestwickia Lubbock.	
8. Funicle 4-jointed, the club one-jointed.	
Front wings with a tong marginal fringe.	
Metanotum without carine	
Metanotum bicarinate	
Front wings with a short marginal fringe	
Subfamily II. Trichogramminæ.	
This subfamily is easily recognized by peculiarities of the front wings, the)
pubescence, being arranged in distinct rows or lines, a peculiarity found in no other	•
group, except to a slight extent in some genera in the subfamily Entedonina, of the	•
family Eulophinæ.	
TABLE OF GENERA.	
1. Females	
Males	
Veins in front wings forming a regular arch. Veins in front wings not forming a regular arch.	
3. Antennæ 8-jointed, the flagellum clavate, the funicle 2-jointed, the joints transverse.	E
Body short, robust	
4. Antennæ 7-jointed or less.	
Antennæ 8-jointed (scape, pedicel, one ring-joint, a 2-jointed funicle and a 3-jointed club).	
Trichogramma Westwood (type T. evanescens Westw.)	
5. Antennæ 6-jointed or less	
Antennæ 7-jointed.	
Wings with a short marginal fringe,	3
Wings with a long marginal fringe	
6. Antennæ with the club 4-jointed (scape, pedicel, one ring-joint and a 4-jointed club).	
Lathromeris Förster (type L. scutellaris Först.)	
7. Antennæ 3- or 6-jointed, without a ring-joint	3
Antennæ 6-jointed, with a ring-joint (scape, pedicel, one ring-joint, a 2-jointed funicle and a solid club)	
Abdomen shorter than the thoraxXanthoatomus Ashmead, gen. nov. (type X.)	
Abdomen subcylindrical, longer than the thorax	Ţ
(type Trichogramma minutum Riley)	
8. Antennæ 3-jointed.)
Antennæ 6-jointed, the club 3-jointed (scape, pedicel, a 1-jointed funicle and a 3-jointed club).	
Postscutellum not distinct, without a triangular projection	
(type Trichogramma Watkeri Först.)	
Postscutellum distinct, with a triangular projection	
(type P. punctata How.)	•
9. Club not jointed.	
Marginal fringe not especially long, the marginal vein not more than twice as long as the stigma	
vein	
10. Autennæ 7-jointed or less.	L
Antennæ 8-jointed.	

Veins of front wings forming a regular arch; flagellum filiform Poropæa Förster	r.
Veins of front wings not forming a regular archTrichogramma Westwood	ł.
11. Antennæ 6-jointed or less	2
Antennæ 7-jointed.	
Wings with a very long marginal fringe	7.
Wings with a short marginal fringe.	
Club of antennæ 4-jointed Lathromeris Förster	r.
Club of antennæ 3-jointed	7.
12. Antennæ 6-jointed (scape, pedicel, a 1-jointed funicle and a 3-jointed club), marginal vein abou	ıt
thrice as long as the stigmal	r.
Antennæ 3-jointed (scape, pedicel and a long, solid club); marginal vein not more than twice the	e
length of the stigmal vein).

FAMILY LXXIII. MYMARIDÆ.

- 1833. Mymares, Tribus 5^{ta}, Haliday, Ent. Mag., I., p. 341.
- 1839. Mymaridæ, Family 17, Haliday, Hym. Syn., p. II.
- 1840. Mymarides, Subfamily 6 (Family Proctotrypidæ), Westwood, Intro. Mod. Class. Ins. Synop., p. 78.
- 1856. Mymaroidæ, Familie 28, Förster, Hym. Stud., II., pp. 20, 27 and 116.
- 1897. Mymaridæ, Family LXXIII., Ashmead, Proc. Ent. Soc. Washington, IV., p. 236.

This group was correctly defined by A. H. Haliday, first as a tribe and afterwards as a distinct family.

In 1833 in speaking of it he says: "This tribe comprises the very atoms of the order Hymenoptera. Their hues are mostly black or yellowish, unadorned by metallic splendor: the plumed and iridescent wings of many are beautiful objects for the microscope. The males, by their very long and slender antennæ (sometimes more than twice the length of the body), resemble Ichneumons in miniature."

Every species belonging to the family lives parasitically in the eggs of other insects, and in habits agree with the *Trichogrammida*.

Stephens, Curtis, Walker, Westwood, Förster, Thomson and most systematists treat the group as a component of the *Proctotrypoidea* and Dr. von Dalla Torre in his *Catalogus Hymenopterorum* follows these older authorities and treats it as a subfamily in the *Proctotrypidæ*. More than ten years ago I pointed out the structural characters that excluded the group from having any affinity with these insects; they are widely distinct in many particulars and form a compact natural family in the Chalcidoidea, as was first pointed out by Haliday so many years ago. My extensive studies into all groups of the Hymenoptera have only confirmed and emphasized the correctness and soundness of Haliday's views, the ablest systematist of his day, and his views should prevail.

Two subfamilies have been defined, separated by the number of joints in the
tarsi.
TABLE OF SUBFAMILIES.
Tarsi 5-jointed. Subfamily I. Gonatocerinæ. Tarsi 4-jointed. Subfamily II. Mymarinæ.
Subfamily I. Gonatocerinæ.
The subfamily is easily recognized by the longer tarsi which are always 5-jointed, never 4-jointed.
Two tribes may be distinguished by the following simple characters:
TABLE OF TRIBES.
Abdomen petiolate
Tribe I. Ooctonini.
TABLE OF GENERA.
1. Females
Tribe II. Gonatocerini.
The distinctly petiolated abdomon distinguishes the tribe.
TABLE OF GENERA.
1. Females 2 Males 4 2. Antennæ more than 8-jointed 3 Antennæ 8-jointed 3
Marginal vein long
3. Antennæ 9-jointed; marginal vein longLitus Haliday (type L. cynipseus Hal.). ? = Malfattia Meunier (type M.molitoræ Meun.).
Antennæ 11-jointed; marginal vein short
4. Marginal vein short 5
Marginal vein long.
Antennæ 11-jointed
Antennæ 13-jointed
Antennæ 13-jointed

SUBFAMILY II. MYMARINÆ.

In this subfamily fall some of the smallest Hymenoptera known, hardly visible to the naked eye, and living parasitically in the eggs of some other small insect.

The group is distinguished by having the tarsi 4-jointed, not 5-jointed as in the Gonatocerinæ.

It is divided by the attachment of the abdomen into two tribes.

TABLE OF TRIBES.
Abdomen sessile or subsessile
Abdomen distinctly petiolate
Tribe I. Anaphini.
The sessile abdomen distinguishes the tribe.
TABLE OF GENERA.
1. Females
Males
2. Antennæ more than 8-jointed
Antennæ 8-jointed
3. Antennæ 9-jointed.
Marginal vein lengthened
Marginal vein not lengthened
4. Antennæ more than 9-jointed
Antennæ 9-jointed
5. Antennæ 12-jointed; marginal vein long
Antennæ 13-jointed; marginal vein short
Tribe II. Mymarini.
In this tribe the abdomen is always distinctly petiolate, never sessile.
TABLE OF GENERA.
1. Females 2
Males 7
2. Antennal club solid, unjointed 4
Antennal club 2-jointed
3. Marginal vein long; tarsi short Eustochus Haliday (type E. atripennis Hal.).
Marginal vein short; tarsi long
4. Marginal vein either lengthened or punctiform, but never wholly absent
Marginal and other veins absent. Hind wings wanting or aborted; front wings neither spoon-shaped nor much broadened at apex,
sometimes split into two parts
Hind wings present, normal; front wings spoon-shaped; antennæ 9-jointed.
Mymarilla Westwood (type M. taprobanica Westw.).

5. Front wings widened only at apex and with a long marginal fringe; antennæ 9-jointed.
Mymar Haliday (type M. pulchellus Hal.).
Front wings not wide, sometimes split at apex; antennæ apparently but 3-jointed.
Packardiella Ashmead (type Pteratomus putmanii Pack.).
6. Antennæ 9-jointed.
Marginal vein punctiform Polynema Haliday (type Ichneumon ovulorum Hal.).
Marginal vein lengthened.
Metanotum without a carina Stichothrix Förster (type S. cardui Först.).
Metanotum with two carineCeraphractus Haliday (type C. cinctus Hal.).
7. Marginal vein punctiform or lengthened
Marginal vein and all others absent or wanting.
Front wings narrow, usually somewhat broader toward apex, or linear or split at apex; hind
wings usually absent or aborted 8
Front wings broad, spoon-shaped; hind wings entire.
Antennæ 13-jointed
8. Front wings not split at apex; antennæ 13-jointed
Front wings linear or split at apex; antennæ (?) imperfect
9. Marginal vein lengthened
Marginal vein punctiform. Antennæ 13-jointed
10. Antennæ 10-jointed; metanotum smooth, without a carina
Antennæ 11-jointed; metanotum bicarinate
Genera unknown to Author and not Classified.
Chalcites Heer (Fossil), Vierteljahrschr. naturf. Ges. Zurich, I., 1856, p. 26. (Type
C. debilis Heer.)
Cynipsichneumon Christ, Naturg. d. Insect., 1791, p. 377. (Type not mentioned.)
Lycus Walker, Ann. Mag. Nat. Hist., X., 1843, p. 114. (Type L. origo Walker.)
Belongs evidently to the <i>Microgasteridæ</i> .
Norbanus Walker, Ann. Soc. ent. France (2), I., 1843, p. 158. (Type N. dysaules
Walker.)
Peridesmia Förster, Hym. Stud., II., 1856, p. 65. (No type given.)
Prionopus Dalman, Svensk. VetAkad. Handl., XLVI., 1825, p. 393. (No type
given.)
GENERA INCORRECTLY PLACED WITH THE CHALCIDOLDEA

GENERA INCORRECTLY PLACED WITH THE CHALCIDOIDEA.

Agonophorus Dalman, Öfvers. Svensk. Vet.-Akad. Förhl., XIV., 1857, p. 287. (No type given.)

Belongs evidently to the superfamily Proctotrypoidea.

Diplalepis Fabricius, Syst. Piez., 1804, p. 149 (= Diastrophus). Belongs to the superfamily Cynipoidea, family Cynipide.

Macrostigma Rondani, Bull. Soc. ent. Ital., IX., 1877 (= Megastigmus Dalman). Belongs to the superfamily Proctotrypoidea, family Ceraphreninæ. Trichacis Provancher, Add. Fn. Hym. du Canada, 1887, p. 207 (= Bæus Haliday).

Belongs to the superfamily Proctotrypoidea, family Scelionina.

BIBLIOGRAPHY OF THE GENERA.

Camptoptera Förster, Hym. Stud., II., 1856, pp. 116, 119, 144. (Type C. papaveris Först.)

Caraphractus Haliday, Ann. Mag. Nat., XVIII., 1846, p. 52. (Type C. cinctus Haliday.)

Caratomus Thomson (= n. n. for Cratomus Dalman), Hym. Skand., V., 1878, p. 45.

Cardiogaster Motschulsky, Bull. Soc. Natural. Moscow, XXXV., 1863, p. 72. (Type C. fusciventris Motschulsky.)

Catolaccus Thomson, Hym. Skand., V., 1878, p. 152. (Type C. cavigena Thomson.)

Caudonia Walker, Ann. & Mag. Nat. Hist. (2), V., 1850, p. 125. (Type C. agylla Walk.)

Cea Haliday, Ent. Mag., IV., 1837, p. 356. (Type C. pulicaris Hal.)

Cecidostiba Thomson, Hym. Skand., V., 1878, p. 92. (Type C. rugifrons Thomson.)

Cecidoxenus Ashmead, gen. nov., ante, p. 274. (Type C. nigrocyaneus Ashm.)

Centrobia Förster, Hym. Stud., II., p. 87.

Centrodora Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 66. (Type C. amæna Först.)

Cephaleta Motschulsky, Étud. entom., VIII., 1859, p. 173. (Type C. purpuriventris Motsch.).

Cerambycobius Ashmead, Proc. Ent. Soc. Washington, IV., 1896, p. 17. (Type Eupelmus cleri Ashm.)

Ceranisus Walker, The Entom., I., 1840, p. 6; pl. N, f. 2. (Type Cirrospilus pacuvius Walker.)

Cerapterocerus Westwood, Mag. Nat. Hist., VI., 1833, p. 495. (Type C. mirabilis Westw.)

Ceratomus Dalman (= Cratomus Dalman), Svensk. Vet.-Akad. Handl., XLIII., 1822, p. 495. (Type Cynips megacephalus Fabr.)

Ceratoneura Ashmead, Jour. Linn. Soc. London, Zoöl., XXV., 1894, p. 178. (Type C. petiolata Ashm.)

Ceratosmicra Ashmead, gen. nov. ante, p. 251. (Type C. petiolata Ashm.)

Ceratosolen Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1888, p. 164. (Type C. appendiculatus Mayr.)

Cerchysius Westwood, Lond. & Edinb. Phil. Mag. (3), I., 1832, p. 128. (Type Encyrtus subplanus Dalm.)

Cercobelus Walker, Ent. Mag., V., 1837, p. 48. (Type C. jugeus Walk.)

Cerocephala Westwood, Mag. de Zool., II., 1832, Pt. 4, T. 4. (Type C. corriger Westw.)

Chætospila Westwood (= Cerocephala Westw.) Thesaur. Ent. Oxon., 1874, p. 173.

Chetosticha Haliday, Ann. & Mag. Nat. Hist. (2), VII., 1851, p. 210. (Type C. dimidiata Hal.)

Chætostrinx Förster (= n. n. for Chætostricha Hal.), Hym. Stud., II., 1856, p. 89.

Chalcaspis Howard, Proc. U. S. Nat. Museum, XVII., 1895, p. 606. (Type C. pergandei How.)

Chalcidectes Walker, Ann. & Mag. Nat. Hist. (2), X., 1852, p. 47. (Type C. maculicornis Walk.)

Chalcis Fabricius, Mant. Insect., I., 1789, p. 272. (Type Vespa minuta Linné.)

Chalcitella Westwood, Proc. Zoöl. Soc. London, III., 1835, p. 56. (Type C. evanioides Westw.)

Chalcites Heer (fossil), Vierteljahr. naturf. Ges. Zurich, I., 1856, p. 296.

Chalcodectes Dalla Torre (n. n. for Chalcedectes Walker), Cat. Hym., V., 1898, p. 186.

Chalcura Kirby, Journ. Linn. Soc. London, Zoöl., XX., 1886, p. 30. (Type Eucharis deprivata Walk.)

Charitolophus Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 70. (Type C. cœrulescens Först.)

Charitopus Förster, Hym. Stud., II., 1856, p. 31. (Type C. fulviventris Först.)

Chartocerus Motschulsky, Étud. entom., VIII., 1859, p. 171. (Type C. musciformis Motsch.)

Cheiloneurus Westwood, Lond. & Edinb. Phil. Mag. (3), III., 1833, p. 343. (Type C. formosus Westw.)

Cheiropachys Westwood, Zoöl. Journ., IV., 1828, p. 25. (Type Sphex colon Linné.)

Chestomorpha Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, pp. 335, 343, 370. (Type C. biformis Ashm.)

Chiloneurus Förster (n. n. for Cheiloneura Westwood), Hym. Stud., II., 1856, p. 32.

Chirocera Latreille (= Hippota Walker), Gen. Crust. et Ins., IV., 1809, p. 26. (Type Chalcis pectinicerus Latreille.)

Chirocerus Brullé (= Kapala Cameron), Hist. nat. d. Ins., IV., 1846, p. 571.

Chirolophus Haliday, Ann. Soc. ent. France (4), II., 1862, p. 115. (Type C. eques Haliday.)

Chiropachus Agassiz (n. n. for Cheiropachys Westw.), Agassiz, Nom. Zool., Hym., 1848, p. 77.

Chiropachys Thomson (n. n. for Cheiropachys Westw.), Hym. Skand., V., 1878, p. 32.

Choreia Westwood, Mag. Nat. Hist., VI., 1833, p. 122. (Type Encyrtus ineptus Dalman.)

Choreius Westwood (n. n. for Choreia Westw.), Lond. & Edinb. Phil. Mag. (3), X., 1839, p. 444.

Choria Vollenhoven (n. n. for Choria Westw.), Schets., 1871, Tab. 7.

Chryseida Spinola, Mag. de Zool., X., 1840, p. 7. (Type C. superciliosa Spin.)

Chrysoatomus Ashmead, gen. nov., ante, p. 342. (Type C. Zealandicus Ashm.)

Chrysocharis Förster, Hym. Stud., II., 1856, p. 47. (Type C. femoralis Först.)

Chrysocharodes Ashmead, Jour. Linn. Soc. London, Zoöl., XXV., 1894, p. 177. (Type C. petiolata Ashm.)

Chrysocharoideus Ashmead, ante. (Type Chrysocharis thoracicus Ashmead.)

Chrysoglyphe Ashmead, Jour. Linn. Soc. London, Zoöl., XXV., 1894, p. 160. (Type *C. apicalis* Ashm.)

Chrysolampus Spinola, Ann. mus. hist. nat., XVII., 1811, p. 147. (Type C. splendidulus Spin.)

Chrysomalla Förster, Verh. d. naturh. Ver. pr. Rheinl., XVI., 1859, p. 115. (Type *C. roseri* Först.)

Chrysonotomyia Ashmead, gen. nov., ante, p. 344. (Type Eulophus auripunctatus Ashmead.)

Chrysoplatycerus Ashmead, Can. Ent., XXI., 1889, p. 38. (Type Rileya splendens How.)

Chrysopophagus Ashmead, Ins. Life, V., 1894, p. 246. (Type C. compressicornis Ashmead.)

Cirrospiloideus Ashmead, gen. nov., antc, p. 354. (Type Miotropis platynotæ How.)

Cirrospilus Förster nec Westwood (= Stenomesioidius Ashm. part), Hym. Stud., II., 1856, p. 74.

Cirrospilus Westwood, Phil. Mag. (3), I., 1832, p. 128. (Type C. elegantissimus Westw.)

Cleonymus Latreille, Gen. Crust. et Ins., IV., 1809, p. 29. (Type Ichneumon depressus Fabr.)

Cleptimorpha Walker, Notes on Chalc., Pt. 5, 1872, p. 84. (Type C. binotata Walker.)

Cleptomorpha Dalla Torre (n. n. for Cleptimorpha Westw.), Cat. Hym., V., 1898, p. 185.

Closterocerus Westwood, Mag. Nat. Hist., VI., 1833, p. 419. (Type C. trifasciatus Westw.)

Coccidencyrtus Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, pp. 339, 345. (Type Encyrtus ensifer How.)

Coccobius Ratzeburg, Ichn. d. Forstins., III., 1852, p. 175. (Type unknown.)

Coccophagus Westwood, Lond. & Edinb. Phil. Mag. (3), III., 1833, p. 344. (Type C. pulchellus Westw.)

Coccophoctonus Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, pp. 337, 344 and 375. (Type C. dactylopii Ashm.)

Cœlocyba Ashmead, Proc. Linn. Soc. N. S. Wales, 1900, p. 344. (Type C. nigrocineta Ashm.)

Cælogaster Schrank (= Leucospis Fabr.), Schrift. Ges. naturf. Fr. Berlin, I., 1780, p. 303.

Cœlopisthia Förster, Hym. Stud., II., 1856, p. 65. (Type Pteromalus cephalotes Walker.)

Cælopisthus Thomson (= n. n. for Cælopisthia Först.), Hym. Skand., V., 1878, p. 168.

Cælops Kriechbaumer (= Kriechbaumenella Dalla Torre), Berlin. ent. Zeitschr., XXXIX., 1894,
 p. 316. (Type Cælops palbebrator Kriechb.)

Cænocercus Thomson (= Echthroplexis Förster), Hym. Skand., IV., 1875, p. 145.

Colas Curtis, Brit. Ent., IV., 1827, p. 166. (Type C. dispar Curtis.)

Colax Curtis (= n. n. for Colas Curtis), Guide Brit. Ins., 1829, p. 6.

Colotrechnus Thomson, Hym. Skand., V., 1878, p. 46. (Type C. subcœruleus Thomson.)

Colyostichus Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, p. 158. (Type C. longipes Mayr.)

Comedo Schrank (= Cratotrechus Thomson), Faun. Boica, II., 1802, p. 308 [p. p.].

Comys Förster (= Encyrtus Latreille), Hym. Stud., II., 1856, p. 144.

Conura Spinola, Mag. de Zool., VII., 1837, p. 180. (Type C. flavicans Spinola.)

Copidosoma Ratzeburg, Ichu. d. Forstins., I., 1844, p. 157. (Type C. boucheanus Ratzeb.)

Coruna Walker (= Pachycrepis Förster), Ent. Mag., I., 1833, pp. 371 and 379.

Coryna Reinhard (= Pachycrepis Förster), Berl. Ent. Zeitschr., I., 1857, p. 87.

Corynocera Nees (= Pirene Haliday), Hym. affin. Monogr., II., 1834, p. 123.

Cosmocoma Förster (= n. n. for Polynema Haliday), Hym. Stud., II., 1856, pp. 117, 120.

Crantor Haliday (= Aphelinus Dalman, wingless form), Ent. Mag., I., 1833, p. 268.

Cratæpus Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 62. (Type C. aquisgranensis Först.)

Cratomus Dalman, Svensk. Vet.-Akad. Handl., XLII., 1820, p. 72. (Type Cynips megacephalus Fabr.)

Cratotrechus Thomson, Hym. Skand., V., 1878, p. 219. (Type Ichneumon larvarum Linné.)

Cricellius Thomson, Hym. Skand., V., 1878, p. 102. (Type C. decipiens Thomson.)

Critogaster Mayr (= & Trichaulus Mayr), Verh. Zool.-bot. Gesell. Wien, XXXV., 1888, pp. 160, 199.

Crossogaster Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, pp. 156, 159, 189. (Type C. triformis Mayr.)

Cryptopristus Förster, Hym. Stud., II., 1856, p. 43. (Type Torymus caliginosus Walk.)

Cryptoprymna Förster, Hym. Stud., II., 1856, p. 56. (Type Prosodes atra Walk.)

Cryptoprymnus Thomson (= Cryptoprymna Förster), Hym. Skand., V., 1878, p. 22.

Cycloneura Dahlbom, Öfvers. Svensk. Vet.-Akad. Förh., XIV., 1887, p. 295.

Cyniphoctonus Reinhard (= Olynx Förster), Berl. Ent. Zeitsch., II., 1858, p. 22.

Cynipsichneumon Christ (= Cratotrechus Thomson), Naturg. d. Ins., 1791, p. 378.

Cynipsillum Lamarck (= Perilampus Latreille), Hist. anim. s. Vert., IV., 1817, p. 156.

Cyrtogaster Walker, Ent. Mag., I., 1833, pp. 371, 381. (Type C. vulgaris Walker.)

Cyrtosoma Curtis (= Ormyrus Westwood), Perris Ann. Soc. ent. France, IX., 1840, p. 96.

D.

Dasyglenes Ashmead (= Epistenia Westwood), Can. Ent., XX., 1888, p. 74.

Decatoma Spinola, Ann. mus. hist. nat. XVII., 1811, p. 151. (Type *Diplolepis adonidum* Rossi.)

Decatomidea Ashmead, Ent. Amer., IV., 1888, pp. 42, 43. (Type D. xanthochroa Ashm.)

Decatomothorax Ashmead, gen. nov., ante, p. 273. (Type D. gallicola Ashm.)

Derostenus Westwood, Mag. Nat. Hist., VI., 1833, p. 495. (Type D. gemmeus Westw.)

Destefania Dalla Tarre (n. n. for Sternodes Stefani), Wien. Ent. Zeitg., 1897, p. 88. (Type Sternodes pusateri Stefani.)

Diamorus Walker, Ent. Mag., II., 1834, p. 159. (Type Torymus armatus Boheman.)

Diaulomorpha Ashmead, gen. nov., ante, p. 356. (Type B. australiensis Ashm.)

Diaulus Ashmead (n. n. for Diglyphus Thomson nec Walker), ante, p. 356. (Type D. begini Ashm.)

Dibrachys Förster, Hym. Stud., II., 1856, p. 65. (Type Pteromalus boucheanus Ratzeburg.)

Dicellocerus Menzel (= Mira Shellenberg), Stettin ent. Zeitg., XVII., 1855, p. 270.

Dichalysis Förster (n. n. for Psilocera Walker, of), Hym. Stud., II., 1855, p. 52.

Dichotomus Förster, Verh. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 48. (Type D. acerinus Förster.)

Dicladocerus Westwood, Phil. Mag. (3), I., 1832, p. 128. (Type D. westwoodii Stephens.)

Dicormus Förster (= Cyrtogaster Walker), Beitr. Monogr. Pteromal., 1841, p. 38.

Dicyclus Walker, Ent. Mag., I., 1833, pp. 371, 455. (Type D. lynastes Walk.)

Diglochis Förster, Hym. Stud., II., 1856, p. 65. (Type Pteromalus omnivorus Walk.)

Diglyphomorpha Ashmead, gen. nov., ante, p. 352. (Type Diglyphus? maculipennis Ashmead.)

Diglyphis Thomson (= Diaulus Ashm.), Hym. Skand., V., 1878, p. 235.

Diglyphus Thomson (= Diaulus Ashmead), Hym. Skand., V., 1878, p. 208.

Diglyphus (Haliday) Walker, List. Chalcid. Brit. Museum, II., 1848, p. 235. (Type D. poppæa Walk.)

Dilocantha Shipp, The Entom., XXVII., 1894, p. 188. (Type Thoracantha flavicornis Westw.)

Dilophogaster Howard (= Tomocera Howard), Ent. Amer., II., 1886, p. 98.

Dimachus Thomson, Hym. Skand., V., 1878, pp. 50, 52. (Type C. arenicola Thomson.)

Dimmockia Ashmead, gen. nov., ante, 357. (Type Eulophus incongruus Ashm.)

Dinarmus Thomson, Hym. Stud., V., 1878, p. 56. (Type D. acutus Thomson.)

Dinocarsis Förster (n. n. for Euscapus Dahlbom), Hym. Stud., II., 1856, p. 33. (Type Encyrtus hemipterus Dalm.)

Dinotus Förster, Hym. Stud., II., 1856, p. 66. (Type D. bidentulus Thomson.)

Dipara Walker, Ent. Mag., I., 1833, pp. 371, 373. (Type D. petiolata Walker.)

Diplectron Dahlbom (= Euplectrus Westwood), Öfvers. Svensk. Vet.-Akad. Förh., XIV., 1857, p. 292.

Diplodontia Ashmead, Ent. Amer., IV., 1888, p. 87. (Type Smicra carolina Ashm.)

Diplolepis Fabricius nec Olivier (= Diastrophus Hartig), Syst. Piez., 1804, p. 149.

Dirhicnus Thomson, Hym. Skand., V., 1878, p. 170. (Type D. subcæruleus Thomson.)

Dirhinus Dalman, Svensk. Vet.-Akad. Handl., XXXIX., 1818, p. 75. (Type D. excavatus Dalm.)

Dirrhinus Dalla Torre (n. n. for Dirhinus Dalman), Cat. Hym., V., 1898, p. 367.

Discodes Förster (= Phænodiscus Förster), Hym. Stud., II., 1856, p. 32.

Disema Förster, Verh. naturh. Ver. pr. Rheinl., XXV., 1875, p. 54. (Type D. pallipes Förster.)

Doriclytus Förster, Linn. entom., II., 1847, p. 226. (Type D. vitripennis Förster.)

Doryclitus Dalla Torre (n. n. for Doriclytus Förster), Cat. Hym., V., 1898, p. 428.

E.

Ecdamua Walker, Trans. Ent. Soc. London (3), I., 1862, p. 387. (Type E. macrotelus Walk.)

Echthroplectis Dalla Torre (n. n. for Echthroplexis Förster), Cat. Hym., V., 1898, p. 243.

Echthroplexis Förster, Hym. Stud., II., 1856, p. 33. (Type Cenocercus puncticollis Thomson.)

Ecrizotes Förster, Progr. Realsch. Aachen, 1861, p. xxxiii. (Type E. monticola Förster.)

Ectroma Westwood, Lond. & Edinb. Phil. Mag. (3), III., 1833, p. 344. (Type Eupelmus rufus Dalman.)

Eisenia Ashmead, gen. nov. ante, p. 233. (Type E. mexicana Ashm.)

Elachertomorpha Ashmead, gen. nov., ante, p. 352. (Type E. flaviceps Ashm.)

Elachertus Spinola, Ann. mus. hist. nat., XXVII., 181-, p. 151. (Type E. abdominalis Spin.)

Elachestus Walker (n. n. for Elachertus Spinola), List. Chalc. Brit. Museum, I., 1848, p. 68.

Elachistus Thomson (n. n. for Elachertus Spinola), Hym. Skand., V., 1878, pp. 187, 191.

Elasmus Westwood, Philos. Mag. (3), III., 1833, p. 343. (Type Eulophus flabellatus Fonscolombe.)

Elatus Walker, List. Chalc. Brit. Museum, II., 1848, p. 153. (Type E. thenæ Walk.)

Enargopelte Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 62. (Type *E. obscura* Förster.)

Encarsia Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 65. (Type E. tricolor Förster.)

Encyrtaspis Ashmead, gen. nov., ante, p. 290. (Type E. brasiliensis Ashm.)

Encyrtus Latrielle, Gen. Crust. et Ins., IV., 1809, p. 81. (Type Chrysis infidus Rossi.)

Endomychobius Ashmead, Trans. Am. Ent. Soc., XXIII., 1896, p. 227. (Type E. flavipes Ashm.)

Eniaca Kirby, Journ. Linn. Soc. London, Zoöl., XVII., 1883, p. 57. (Type Chalcis hesperidum, Rossi.)

Enneasmicra Ashmead, gen. nov., ante, p. 252. (Type Smicra eximanius Walk.)

Enneatoma (Spinola) Dahlbom (= Eurytoma Illiger), Öfvers. Svensk. Vet.-Akad. Förh., XIV. 1857, p. 292.

Entedon Dalman, Svensk. Vet.-Akad. Handl., XLI., 1820, p. 136. (Type E. cyanellus Dalman.)

Epiclerus Haliday (= Tetracampe Förster), Trans. Ent. Soc. London, III., 1843, p. 297.

Epicopterus Westwood, Mag. Nat. Hist., VI., 1833, p. 418. (Type E. choreiformis Westw.)

Epiencyrtus Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, p. 340. (Type *Encyrtus thyreo-dontis* Ashm.)

Epinæus Walker (= Cerocephala Westwood), Ent. Mag., I., 1833, p. 368.

Epinæoideus Ashmead, gen. nov., ante. (Type E. melanocephalus Ashm.)

Epinæus Kirby, Journ. Linn. Soc. London, Zoöl., XVII., 1883, p. 58. (Type Smicra dux Walk.)

Epipteromalus Ashmead, gen. nov., ante, p. 319. (Type E. algonquieniis Ashm.)

Epistenia Westwood, Griffiths' Anim. Kingd., Ins., II., 1832, p. 432. (Type E. cæruleata Westw.)

Epitelia Kirby, Journ. Linn. Soc. London, Zoöl., XVII., 1883, p. 61. (Type Chalcis stylata Walk.)

Epitranus Walker, Ent. Mag., II., 1834, pp. 21, 26. (Type E. fulvescens Walk.)

Eretomocerus Haldeman, Am. Journ. Sci. & Arts (2), IX., 1850, p. 111. (Type E. corni Haldeman.)

Ericydnus Walker, Ent. Mag., IV., 1837, p. 363. (Type Encyrtus longicornis Dalman.)

Eriophilus Haldeman (= Aphelinus Dalman), Penn. Farm. Journ., August, 1851, p. 130.

Erotolepsia Howard, Journ. Linn. Soc. London, Zoöl., XXV., 1894, p. 99. (Type E. compacta How.)

Etroxys Westwood, Mag. Nat. Hist., VI., 1833, pp. 121 and 495. (Type *E. pulcherrimus* Westw.)

Euchalcis Dufour, Ann. Soc. ent. France, 1861, p. 8. (Type E. miegii Dufour.)

Eucharis Latreille, Hist. nat. Crust. et Ins., III., 1802, p. 210. (Cynips adsendens Fabr.)

Eucharissa Westwood, Trans. Ent. Soc. London, 1868, Proc., p. xxxvi. (Type E. speciosa Westw.)

Euchrysia Westwood, Thes. ent. Oxon., 1874, p. 139. (Type E. cleptidea Westw.)

Eucomys Förster (n. n. for Comys Förster (= Encyrtus Latr.), Hym. Stud., II., 1856, p. 32.

Eudecatoma Ashmead, Entom. Amer., IV., 1888, pp. 42, 43. (Type E. batatoides Ashm.)

Euderus Haliday, Trans. Ent. Soc. London, III., 1843, p. 298. (Type Entedon amplus Walker.)

Euderus Thomson nec Haliday (= Trichoporus Förster), Hym. Skand., V., 1878, p. 276.

Eudoxima Walker (= Eudoxinna Walker), Notes in Chalc., Pt. IV., 1871, p. 55.

Eudoxinna Walker (n. n. for Sosvetra Walk.), Trans. Ent. Soc. London (3), II., 1864, p. 207. (Type Sosvetra transversa Walk.)

Eulophopteryx Ashmead, gen. nov., ante, p. 341. (Type E. chapadæ Ashmead.)

Eulophus Geoffrey, Hist. abr. Ius., II., 1762, p. 312. (Type Ichneumon pectinicornis Linné.)

Euneura Walker, Ann. & mag. nat. hist., XIV., 1844, p. 331. (Type E. augarus Walk.)

Eunotus Walker, Ent. Mag., II., 1834, p. 497. (Type E. cretaceus Walk.)

Euophthalmoneyia Ashmead, gen. nov., ante, p. 339. (Type E. pallidopes Ashm.)

Euoxysoma Ashmead, Ent. Amer., IV., 1888, pp. 42, 43. (Type Systole brachyptera Ashm.)

Eupelminus Dalla Torre (n. n. for *Urocryptus* Westwood), Wien. ent. Zeitg., XVI., 1897, p. 85. (Type *Urocryptus excavatus* Westwood.)

Eupelmus Dalman, Svensk. Vet.-Akad. Handl., XLI., 1820, p. 377. (Type E. memnonius Dalman.)

Euperilampus Walker, Notes in Chalc., pt. 4, 1871, p. 67. (Type Perilampus gloriosus Walk.)

Euplectrus Westwood, Philos. Mag. (3), I., 1832, p. 128. (Type Pteromalus bicolor Swederus.)

Eupristina Saunders, Trans. Ent. Soc. London, 1883, p. 5. (Type E. masonii Saund.)

Eupsilocera Westwood (n. n. for Psilocera Walker), Intro. Mod. Class. Ins., II., 1844; Synop., p. 69.

Eurycephalus Ashmead (= Eurycranium Ashm.), Indian Museum Notes, 1903, p. 61.

Eurycranium Ashmead, n. n. for Eurycephalus Ashm. preoc. ante, p. 326. (Type E. alcocki Ashm.)

Eurydinota Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 42. (Type E. leptomera Först.)

Euryischia Howard, Rep. U. S. Dept. Agric., 1888-89, p. 92. (Type E. lestophoni Howard.)

Euryophrys Förster, Hym. Stud., II., 1856, p. 144. (Type Calypso servatulæ Hal.)

Euryrhopalus Howard, Proc. U. S. Nat. Museum, XXI., 1898, p. 237. (Type E. schwarzi How.)

Euryscapus Förster (= Mira Schellenberg), Hym. Stud., II., 1856, p. 32.

Eurytoma Illiger, Rossi, Faun. Etrus., 2a, 11, 1807, p. 128. (Type E. planata Illiger.)

Eurytomocharis Ashmead, Entom. Amer., IV., 1888, pp. 42, 43. (Type E. minuta Ashm.)

Eusandalum Ratzeburg, Ichn. d. Förstius., III., 1852, p. 199. (Type E. abbreviatum Ratzeb.)

Euscapus Dahlbom (= Dinocarsis Förster), Öfvers. Svensk. Vet.-Akad. Förh., XIV., 1857, p. 292.

Eusemion Dahlbom, Öfvers. Svensk. Vet.-Akad. Förh., XIV., 1857, p. 292. (Type Encyrtus corriger Haliday.)

Eustochus Haliday, Ent. Mag., I., 1833, p. 349. (Type E. atripennis Haliday.)

Eustypinra Ashmead, gen. nov., ante, p. 261. (Type E. bicolor Ashm.)

Eutelus Walker, Ent. Mag., II., 1834, p. 356. (Type E. vulgaris Walk. ♀, dilectus Walk. ♂.)

Eutriche Nees (= Polynema Haliday (partim) = Ooctonus Haliday (partim), Ichn. affin. Monogr., II., 1834, p. 196.

Eutrichosoma Ashmead, gen. nov., ante, p. 291. (Type E. mirabile Ashm.)

Exochlænus Shipp, Ent. Mo. Mag., XXVII., 1894, p. 245. (Type Leucospis anthidioides Westw.) Exurus Philippi (= Trichoporus Förster), Stettin. ent. Zeitg., XXXIV., 1873, p. 296.

Panstenon Walker, List Chalc. Brit. Museum, I., 1846, p. 29. (Type *Miscogaster oxylus* Walk.) Panthalis Cameron (= Cameronella Dalla Torre), Proc. Manchester Phil. Soc., XXVI., 1888, p. 121.

Panthus Walker (= Gonatocerus Nees), Ann. & Mag. Nat. Hist., XVIII., 1846, p. 52.

Paphagus Walker, Ann. & Mag. Nat. Hist., XII., 1843, p. 47. (Type P. sidero Walker.)

Paracaratomus Ashmead, Trans. Amer. Ent. Soc., XXI., 1894, p. 335. (Type P. cephalotes Ashmead.)

Paracentrobia Howard, Journ. Linn. Soc. London, Zoöl., XXVI., 1896, p. 178. (Type *P. punctata* Howard.)

Paracrias Ashmead, gen. nov., ante, p. 343. (Type P. laticeps Ashm.)

Paralæsthia Cameron, Biol. Centr.-Amer. Hym., I., 1884, p. 110. (Type *P. mandibularis* Cameron.)

Paraolinx Ashmead, Journ. Linn. Soc. London, Zoöl., XXV., 1894, p. 166. (P. lineatifrons Ashmead.)

Parapsilophrys Howard, Proc. U. S. Nat. Mus., XXI., 1898, p. 232. (Type P. gelechiæ How.)

Parasaphes Ashmead, gen. nov., ante, p. 328. (Type P. iceyæ Ashm.)

Paraterobia Ashmead, gen. nov., ante, p. 274. (Type P. nigriceps Ashm.)

Parapteromalus Ashmead, gen. nov., ante, p. 322. (Type P. isosomatis Ashm.)

Parencyrtus Ashmead, Proc. U. S. Nat. Mus., XXII., 1900, pp. 335, 342. (Type P. brasiliensis Ashm.)

Pediobius Walker, Ann. & Mag. Nat. Hist., XVII., 1846, p. 184. (Type Entedon imbreus Walker.)

Pegopus Förster (n. n. for *Prosopon* Walker), Hym. Stud., II., 1856, p. 145. (Type *Prosopon montanus* Walker.)

Pelecinella Westwood, Trans. Ent. Soc., London, 1868; Proc., p. xxxv. (Type P. phantasma Westw.)

Pelorotelus Ashmead, gen. nov., ante, p. 341. (Type P. cæruleus Ashm.)

Pentacladia Westwood, Proc. Zoöl. Soc. London, III., 1835, p. 69. (Type P. elegans Westw.)

Pentacnemus Howard, Proc. U. S. Nat. Mus., XV., 1892, p. 366. (Type P. bucculatricis Howard.)

Pentarthron Riley, Record Amer. Ent. for 1871 (1872), p. 8. (Type T. minutum Riley.)

Pentarthrum Dalla Torre (n. n. for Pentarthron Riley), Cat. Hym., V., 1898, p. 2.

Pentasmicra Ashmead, gen. nov., ante, p. 252. (Type P. brasiliensis Ashm.)

Pentastichus Ashmead, John. Linn. Soc. London, XXV., 1894, p. 187. (Type P. xanthopus Ashm.)

Pentelicus Howard, Proc. U. S. Nat. Mus., XVII., 1895, p. 611. (Type P. aldrichi Howard.)

Peridesmia Förster, Hym. Stud., II., 1856, p. 65. (Type unknown.)

Periglyphus Boheman (= Ormyrus Westwood), Svensk. Vet.-Akad. Handl., LIV., 1833, p. 378.

Perilampus Latreille, Gen. Crust. et Ins., IV., 1809, p. 30. (Type Cynips italica Fabr.)

Perissopterus Howard, Techn. Series, No. 1, U. S. Dept. Agric., 1895, p. 20. (Type Aphelinus pulchellus Howard.)

Pezobius Förster (=wingless ♀ of Ericydnus Walker), Verh. d. naturh. Ver. pr. Rheinl., XVII., 1860, p. 129.

Phacostoma Nees (=Halticoptera Spinola), Ichn. affin. Monogr., ii., 1834, p. 121.

Phanacra Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 51. (Type P. nubigera Först.)

Phænodiscus Förster, Hym. Stud., II., 1856, p. 144. (Type Encyrtus æneus Dalman.)

Phagona Curtis (= Halticoptera Spinola), Brit. Ent., IX., 1832, p. 427.

Phasganophora Dalla Torre (n. n. for Phasgonophora Westwood), Cat. Hym., V., 1898, p. 371.

Phasgonophora Westwood, Griffith's Anim. Kingdom, Ins., II., 1832, p. 77. (Type P. sulcata Westw.)

Pheidoloxenus Ashmead, gen. nov., ante, p. 328. (Type P. wheeleri Ashm.)

Philachyra Haliday, Walker, Notes on Chalc., Pt. 1, 1871, p. 7. (Type P. ips Haliday.)

Philomides Haliday, Ann. Soc. ent. France (4), II., 1862, p. 115. (Type P. paphius Haliday.)

Philotrypesis Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 59. (Type *Cynips carieæ* Hasselquest.)

Phlebopenes Perty, Delect., anim. artic. Brasil, 1833, p. 131. (Type P. splendidus Perty.)

Photismus Thomson, Hym. Skand., V., 1878, p. 15. (Type P. nibilosus Thomson.)

Phylloxeroxenus Ashmead, Entom. Amer., IV., 1888, pp. 42, 43. (Type Eurytoma phylloxerece Ashm.)

Physeus Howard, Bull. U. S. Dept. Agric. Techn. Series, No. 1, 1895, p. 43. (Type Coccophagus varicornis How.)

Physothorax Mayr, Ver. Zool.-bot. Gesell. Wien, XXXV., 1885, pp. 159, 196. (Type Physothorax discigera Mayr ♂, Diamorus variabilis Mayr ♀.)

Picroscytus Thomson (=Arthrolysis Förster), Hym. Skand., V., 1878, p. 58.

Pirene Haliday, Ent. Mag., I., 1833, p. 336. (Type P. varicornis Hal.)

Plastocharis Förster (n. n. for Thysanus Haliday), Hym. Stud., II., 1856, p. 145.

Platygerrhus Thomson, Hym. Skand., V., 1878, p. 13. (Type P. gracilis Thomson.)

Platymesopus Westwood, Lond. & Edin., Phil. Mag. (3), II., 1833, p. 444. (Type P. tibialis Westw.)

Platyneura Motschulsky, Bull. Soc. Natural. Moscow, XXXVI., 1863, p. 51. (Type P. testacea Motsch.)

Platynocheilus Westw., Ent. Mag., IV., 1837, p. 436. (Type P. erichsonii Westw.)

Platyscapha Motschulsky, Bull. Soc. Natural. Moscow, XXXVI., 1863, p. 47. (Type P. frontalis Motsch.)

Platyterma Walker, Ent. Mag., II., 1834, p. 303. (Type P. nobile Walk.)

Platytermus Thomson (n. n. for Platyterma Walker), Hym. Skand., V., 1878, p. 75.

Pleistodontes Saunders, Trans. Ent. Soc. London, 1883, p. 8. (Type P. imperialis Saund.)

Plesiostigma Mayr, Verh. Zoöl.-bot. Gesell. Wien, XXX., 1885, p. 226. (Type P. bicolor Mayr.)

Plesiostigmodes Ashmead, gen. nov., ante, p. 243. (Type P. brasiliensis Ashm.)

Pleuropachus Westwood, Ent. Mag., IV., 1837, p. 437, fig. 1. (Type Entedon costalis Dalman.)

Pleuropachys Förster (n. n. for Pleurapachus Westwood), Hym. Stud., II., 1856, p. 78.

Pleurotropis Förster, Hym. Stud., II., 1856, p. 78. (Type Entedon bimacularis Dalm.)

Plutothrix Förster, Hym. Stud., II., 1856, p. 46. (Type unknown.)

Podagrion Spinola, Ann. mus. hist. nat., XVII., 1811, p. 147. (Type P. splendens Spin.)

Polanisa Walker, The Entom., VIII., 1875, p. 17. (Type Idarnes transiens Walk.)

Polistomorpha Westwood, Zeitschr. f. Entom., I., 1839, p. 265. (Type P. surinamensis Westw.)

Polycelis Thomson (= Polyscelis Dalla Torre), Hym. Skand., V., 1878, p. 143.

Polychroma Westwood (= Chalcedectes Walker), Ther. Ent. Oxon., 1874, p. 140.

Polychromatium Dalla Torre (n. n. for Chalcedectes Walker), Cat. Hym., V., 1898, p. 186.

Polycystus Westwood, Intro. Mod. Class. Ins., II., 1840; Synop., p. 68. (Type P. matthewsii Westw.)

Polymoria Förster, Hym. Stud., II., 1856, p. 31. (Type P. coronata Thoms.)

Polyscelis Dalla Torre (n. n. for *Polycelis* Thomson), Wien. ent. Zeitg., XVI., 1897, p. 87. (Type *Pteromalus conspersus* Walker.)

Poropea Förster, Verh. naturh. Ver. pr. Rheinl., VIII., 1851, p. 28; tab. 1, fig. 10^{a-e}. (Type *P. stollwerckii* Först.)

Prestwichia Lubbock, Trans. Linn. Soc. London, XXIV., 1863, p. 140. (Type P. aquatica Lub.) Priomerus Walker (= Podagrion Spinola), Ent. Mag., I., 1833, p. 116.

Prionomastix Mayr, Verh. Zool.-bot. Gesell. Wien, XXV., 1875, p. 725. (Type *Encyrtus morio* Dalm.)

Prionomitus Mayr, Verh. Zool.-bot. Gesell. Wien, XXV., 1875, p. 701. (Type *Encyrtus mitratus* Dalm.)

Prionopelma Westwood (= Phlebopenes Perty), Proc. Zoöl. Soc. London, III., 1835, p. 51.

Prionopus Dalman, Svensk. Vet.-Akad. Handl., XLVI., 1825, p. 393.

Pristosmicra Ashmead, gen. nov., ante, p. 261. (Type sexmaculatus Ashm.)

Prodecatoma Ashmead, gen. nov., ante, p. 261. (Type P. flavescens Ashm.)

Proglochin Dalla Torre (n. n. for Proglochis Philippi = Lyciscus Spinola), Cat. Hym. V., 1898, p. 231.

Proglochis Philippi (= Lyciscus Spinola), Stettin. ent. Zeitg., XXXII., 1871, p. 288.

Prosodes Walker (= Cryptoprymna Förster), Ent. Mag., I., 1833, pp. 371, 374.

Protoceras Kirby, Journ. Linn. Soc. London, XVII., 1883, p. 60. (Type Smicra leucotelum Walk.)

Prosopon Walker (= Pegogus Förster), Ent. Mag., IV., 1837, p. 356.

Prospalta Howard, Ins. Life, VII., 1894, p. 6. (Type P. murtfeldtii How.)

Pseudencyrtus Ashmead, Proc. U. S. Nat. Mus., XXII., 1900, pp. 340, 346. (Type Encyrtus cecidomyiæ How.)

Pseudisa Walker (= Sycophila Walker), The Entom., VIII., 1875, p. 15.

Pseudochaleis Kirby, Journ. Linn. Soc. London, Zoöl., XVII., 1883, p. 62. (Type *Halticella declarator* Walk.)

Pseudometagea Ashmead, Proc. Ent. Soc. Washington, IV., 1897, p. 239. (Type Metagea schwarzii Ashm.)

Psilocera Walker, Ent. Mag., I., 1833, pp. 371, 373. (Type P. obscura Walk.)

Psilogaster Blanchard, Hist. Nat. d. Ins., III., 1840, p. 260. (Type P. cupreus Blanch.)

Psilonotus Walker, Ent. Mag., II., 1834, pp. 168, 179. (Type P. adamas Walk.)

Psilophrys Mayr, Verh. Zool-bot. Gesell. Wien, XXV., 1875, p. 727. (Type *Encyrtus longicornis* Walk.)

Psyllæphagus Ashmead, Proc. U. S. Nat. Mus., XXII., 1900, pp. 339, 345. (Type Encyrtus pachypsyllæ How.)

Pteratomus Packard (= Packardiella Ashmead), Proc. Essex Ins., IV., 1864, p. 137.

Pterolycus Ratzeburg (= Merostenus Walker), Ichn. d. Forstius., II., 1848, p. 208.

Pteromalites Heer (Fossil), Urwelt d. Schweis., 1863, p. 388. (Type P. eningensis Heer.)

Pteromalodes Dahlbom, Öfvers. Svensk. Vet.-Akad. Förh., XIV., 1857, p. 295.

Pteromalus Swederus, Svensk. Vet.-Akad. Handl., XVI., 1793, p. 200. (Type *Ichneumon puparum* Linné.)

Pteroncoma Förster (= Platynocheilus Westwood), Beitr. Monogr. Pteromal., 1841, p. 34.

Pterothrix Dalla Torre (n. n. for Pteroptrix Westw. emend.), Cat. Hym., V., 1898, p. 218.

Pteroptrix Westwood, Lond. & Edinb. Phil. Mag. (3), III., 1833, p. 344. (Type P. dimidiatus Westw.)

Pterosema Förster, Verh. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 44. (Type P. varicolor Först.)

Pterotrix Walker (= Pteroptrix Westw. (partim) = Gyrolasia Förster), Monogr. Chalc., I., 1839, p. 12.

Ptinobius Ashmead, Proc. Ent. Soc. Washington, IV., 1895, p. 11. (Type Charitopus magnificus Ashm.)

Rachistus Förster (= Gonatocerus Nees), Linnæa Ent., II., 1847, p. 203.

Raphitelus Harris (= Rhaphitelus Walk.), Rep. Ins. Mass., 3d Ed., 1842, p. 586.

Ratzeburgia Förster (n. n. for Eusandalum Ratzeburg), Hym. Stud., II., 1856, p. 31.

Rhachistus Dalla Torre (n. n. for Rachistus Förster), Cat. Hym., V., 1898, p. 429.

Rhaphidotelus Förster (n. n. for Rhaphitelus Walker), Hym. Stud., II., 1856, p. 62.

Rhaphitelus Walker, Ent. Mag., II., 1833, pp. 168, 178. (Type R. maculatus Walk.)

Rhienopelte Förster, Verh. d. naturh. Ver. pr. Rheinl., XXXV., 1878, p. 55. (Type R. fulviventris Först.)

Rhipipallus Kirby, Journ. Linn. Soc. London, Zoöl., XX., 1886, p. 31. (Type Eucharis volucus Walk.)

Rhopalicus Förster, Hym. Stud., II., 1856, p. 66. (Type Pteromalus guttatus Ratzeb.)

Rhopalotus Förster, Hym. Stud., II., 1855, p. 78. (Type Elachestus cothurnatus Nees.)

Rhopoideus Howard, Proc. U. S. Nat. Mus., XXI., 1898, p. 235. (Type R. citrinus How.)

Rhopus Förster (= Metallon Walker), Hym. Stud., II., 1856, p. 34.

Rhytidothorax Ashmead, Proc. U. S. Nat. Mus., XXII., 1900, pp. 337, 344. (Type R. marlatti Ashm.)

Rileya Ashmead, Ent. Amer., IV., 1888, p. 42; Bull. No. 1, Kansas Agric. College, 1889, App., p. 111. (Type R. cecidomyice Ashm.)

Rileya Howard (= Chrysoplatycerus Ashm.), Can. Ent., XX., 1888, p. 148.

Roptrocerus Ratzeburg, Ichn. d. Forstius., II., 1848, p. 209. (Type R. xylophagorum Ratzeb.)

S.

Saccharissa Kirby, Journ. Linn. Soc. London, Zoöl., XX., 1886, p. 37. (Type Eucharis contingens Walk.)

Sayiella Ashmead, gen. nov., ante, p. 251. (Type Smicra debilis Say.)

Sceptrophorus Förster, Hym. Stud., II., 1856, p. 34. (Type S. sceptriger Först.)

Schizaspidia Westwood, Proc. Zoöl. Soc. London, III., 1835, p. 69. (Type S. furcifera Westw.)

Schizonotus Ratzeburg, Ichn. d. Forstius., III., 1852, p. 230. (Type S. sieboldi Ratzeb.)

Schwarzella Ashmead, gen. nov., ante, p. 256. (Type S. arizonensis Ashm.)

Sciatheres Ratzeburg (= Cerocephala Westw.), Ichn. d. Forstius., II., 1848, p. 209.

Scotolinx Ashmead, gen. nov., ante, p. 354. (Type S. gallicola Ashm.)

Scutellista Motschulsky, Étud. Entom., VIII., 1859, p. 172. (Type S. cyanea Motsch.)

Secodes Förster, Hym. Stud., II., 1856, p. 78. (Type unknown.)

Seladerma Walker, Eut. Mag., II., 1856, p. 288. (Type S. laetum Walk.)

Selimnus Walker, The Eutom., I., 1842, p. 335. (Type S. diores Walk.)

Selitrichus Rondani, Bull. Soc. ent. Ital., IX., 1877, p. 196. (Type S. ceuthorrhynchi Rond.)

Semiotellus Westwood, Intro. Mod. Class. Ins., II., 1840; Synop., p. 70. (Type Semiotus mundus Walk.)

Semiotus Walker (= Semiotellus Westwood), Ent. Mag., II., 1834, pp. 288, 290.

Sericops Kriechbaumer, Berlin. ent. Zeitschr., XXXIX., 1894, p. 68. (Type G. fasciatæ Kriechb.)

Sigmophora Rondani, Ann. Soc. natural. Modena, II., 1868, p. 68. (Type S. scrophulariella Rond.)

Signiphora Ashmead, Orange Ins., 1880, p. 30. (Type S. flavopalliata Ashm.)

Simopterus Förster, Verh. d. naturh. Ver. pr. Rheinl., VIII., 1851, p. 22. (Type S. venustus Först.)

Siphonura Nees (= Ormyrus Westwood), Hym. affin. Monogr., II., 1834, p. 81.

Smaragdites Westwood (= Omphale, Haliday), Mag. Nat. Hist., VI., 1833, p. 419.

Smicra Spinola, Ann. Mus. hist. natur., XVII., 1811, p. 147. (Type Chalcis sispes Fabr.)

Smiera Spinola (= Smiera Spinola err. imp.), loc. cit., supra.

Solenoderus Motschulsky, Bull. Soc. natural. Moscow, XXXVI., 1863, p. 70.

Solenotus Förster, (= Diglyphus Walk.) Hym. Stud., II., 1856, p. 74.

Solenura Westwood, Trans. Ent. Soc. London, 1868, Proc., p. xxxvi. (Type S. telescopica Westw.)

Solindinia Cameron, Trans. Ent. Soc. London, 1883, p. 189. (Type S. cyaniventris Motsch.)

Sosxetra Walker (= Eudoxinna Walker), Trans. Ent. Soc. London (3), I., 1862, p. 370.

Spalangia Latreille, Hist. nat. Crust. et Ins., III., 1802, p. 351. (Type S. nigra Latr.)

Spalangius Say (n. n. for Spalangia Latreille), Contrib. Maclure's Lyc., Phila., II., 1828, p. 79.

Spaniopus Walker, Ent. Mag., I., 1833, p. 371. (Type S. dissimilis Walk.)

Sparthiophilus Rondani (= Euderus Haliday), Bull. Soc. ent. Ital., IV., 1872, p. 208.

Spartiophilus Rondani (= Euderus Haliday), Bull. Soc. ent. Ital., IX., 1877, p. 198.

Sphæripalpus Förster (= Gitgnathus Thomson), Beitr. Monogr. Pteromal., 1841, p. 38.

Sphæropisthus Thomson, Hym. Skand., IV., 1875, pp. 116, 131. (Type S. pascuorum Thoms.)

Sphegigaster Spinola, Ann. mus. hist. nat., XVII., 1811, p. 149. (Type S. pallicornis Spin.)

PART II. SOUTH AMERICAN CHALCIDOIDEA, WITH DESCRIPTIONS OF NEW SPECIES IN THE CARNEGIE MUSEUM.

SUPERFAMILY VII. CHALCIDOIDEA.

FAMILY LX. AGAONIDÆ.

SUBFAMILY I. AGAONINÆ.

Genus BLASTOPHAGA Gravenhorst.

BLASTOPHAGA BIFOSSULATA Mayr.

Blastophaga bifossulata Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 181, ♂♀.— Dalla Torre, Cat. Hym., V., 1898, p. 324.

Brazil: Blumenau (Dr. Fritz Müller).

BLASTOPHAGA BRASILIENSIS Mayr.

Blastophaga brasiliensis Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 180, \mathcal{O}^{\square} Q.—Dalla Torre, Cat. Hym., V., 1898, p. 324.

Brazil: Blumenau (Dr. Fritz Müller).

Genus TETRAPUS Mayr.

TETRAPUS AMERICANUS Mayr.

Tetrapus americanus Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 188, $\sigma \circ \square$. Dalla Torre, Cat. Hym., V., 1898, p. 323.

Brazil: Blumenau (Dr. Fritz Müller).

Genus EISENIA Ashmead.

EISENIA FLAVISCAPA, sp. nov.

Female.—Length about 1 mm.; ovipositor as long as the abdomen and the thorax united. Head and thorax black, polished; hypopygium prominent, piceous; scape broadly dilated, about twice as long as wide, yellow, the pedicel and the flagellum dark brown, the process of the first funicle joint long and acute; legs brownish-yellow, the front and hind femora especially above brownish-piceous; wings hyaline, with short cilie at apex, the veins pale yellowish. The head is a little longer than wide, with a deep broad frontal furrow, the eyes oval; middle tarsi very slightly longer than their tibie.

Brazil: Para. One specimen.

FAMILY LXI. TORYMIDÆ.

Subfamily I. Idarninæ.

Genus IDARNES Walker.

IDARNES BREVICOLLIS (Mayr).

Tetragonaspis brevicollis Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 209, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 320.

Brazil: St. Catharina (Dr. Fritz Müller).

IDARNES CARME Walker.

Idarnes carme Walker, Ann. & Mag. Nat. Hist., XII., 1843, p. 47, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 317.

Tetragonaspis flavicollis Mayr, Verh. Zool.-bot. Gesell., 1885, p. 207, ♀.—Dalla Torre, Cat. Hym., V, 1898, p. 320.

Ganosoma robustum Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 204, ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 321.

West Indies: Grenada, St. Vincent; Brazil: St. Catharina.

Idarnes coriaria (Mayr).

Tetragonaspis coriaria Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 209, ♀.— Dalla Torre, Cat. Hym., V., 1898, p. 320.

Brazil: St. Catharina (Dr. Fritz Müller).

Idarnes forticornis (Mayr).

Tetragonaspis forticornis Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 208, ♀. — Dalla Torre, Cat. Hym., V., 1898, p. 320.

Brazil: St. Catharina (Dr. Fritz Müller).

Idarnes gracilicornis (Mayr).

Ganosoma attenuatum Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 204, 3.

Tetragonaspis gracilicornis Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 208, Q.

Brazil: St. Catharina (Dr. Fritz Müller).

IDARNES PARALLELA (Mayr).

Ganosoma parallelum Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 204, ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 320.

Brazil: St. Catharina (Dr. Fritz Müller).

Idarnes punctata (Mayr).

Tetragonaspis punctata Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 209, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 320.

Brazil: St. Catharina (Dr. Fritz Müller).

Genus TRICHAULUS Mayr.

TRICHAULUS VERSICOLOR Mayr.

Trichaulus versicolor Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 226, \mathcal{Q} ; T. 13, f. 38.—Fr. Müller, Kosmos, XVIII., 1886, pp. 54, 55.

Critogaster singularis Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, p. 200, ♂; T. 12, f. 24. — Fr. Müller, Kosmos, XVIII., 1886, pp. 54, 55. — Dalla Torre, Cat. Hym., V., 1898, p. 321.

Brazil: St. Catharina (Dr. Fritz Müller).

TRICHAULUS FLAVESCENS (Müller).

Critogaster flavescens Müller, Ent. Nachr., XIII., 1887, p. 161, J.—Dalla Torre, Cat. Hym., V., 1898, p. 321.

Brazil: Rio de Janeiro (Dr. Emil A. Göldi).

TRICHAULUS GÖLDIANA (Müller).

Critogaster göldiana Müller, Ent. Nachr., XIII., 1887, p. 161, ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 321.

Brazil: Rio de Janeiro (Dr. Emil A. Göldi).

TRICHAULUS NUDA (Mayr).

Critogaster nuda Mayr, Verh. Zool.-bot. Gesell., XXXV., 1885, p. 201, ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 321.

Brazil: St. Catharina (Dr. Fritz Müller).

TRICHAULUS PILIVENTRIS (Mayr).

Critogaster piliventris Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, p. 201, ♂;
 T. 12, f. 25.—Fr. Müller, Kosmos, XVIII., 1886, p. 55.—Fr. Müller, op. cit.,
 XIX., 1886, p. 54.—Dalla Torre, Cat. Hym., V., 1898, p. 321.

Brazil: St. Catharina (Dr. Fritz Müller).

Genus COLYOSTICHUS (Mayr).

Colyostichus Longicaudis Mayr.

Colyostichus longicaudis Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, p. 239, \mathcal{Q} .

Heterandrium longipes Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, pp. 234–235, ♂. — Dalla Torre, Cat. Hym., V., 1898, p. 316, ♂♀.

Brazil: St. Catharina (Dr. Fritz Müller).

SUBFAMILY II. TORYMINÆ.

Genus LOCHITES Förster.

LOCHITES AURICEPS Ashmead.

Lochites auriceps Ashmead, Journ. Linn. Soc. London, Zool., XX., 1894, p. 153, $\, \circ \,$.

— Dalla Torre, Cat. Hym., V., 1898, p. 284.

W. I.: St. Vincent, Grenada; Brazil: Chapada, in April. Three specimens.

Lachites sulcius (Walker).

Callimome sulcius Walker, Monogr. Chalc., II., 1839, p. 64, Q.

Torymus sulcius Dalla Torre, Cat. Hym., V., 1898, p. 313.

Brazil: Bahia; Chapada, in April. Three specimens.

Genus SYNTOMASPIS Förster.

SYNTOMASPIS CABURA (Walker).

Callimome caburus Walker, Monogr. Chalc., II., 1864, p. 64, ♀♂.

Torymus caburus Dalla Torre, Cat. Hym., V., 1898, p. 301.

Brazil: Bahia (Walker).

SYNTOMASPIS APRILIS, sp. nov.

Female.—Length 2.5 mm.; ovipositor nearly as long as the body. Blue, with a very faint greenish tinge, the abdomen with a decided æneous tinge. Head and thorax shagreened, with a thimble-like punctuation; ocelli pale; eyes brown; scape yellowish, the pedicel æneous, the flagellum dark brown; front and middle femora above and the hind femora blue, the front and middle tibiæ, their tarsi and the hind tarsi, yellowish, the hind tibiæ dark brownish. Wings hyaline, the tegulæ and veins yellowish.

Brazil: Carumba, in April. Two female species.

SYNTOMASPIS HOLCASPOIDEA, sp. nov.

Female.—Length 2 mm.; ovipositor longer than the abdomen. Robust, blue, the head and the thorax with a thimble-like punctuation; ocelli red, placed nearly in a straight line; eyes brown; scape, pedicel, tips of front and middle femora, their tibiæ and tarsi and the hind tarsi, yellowish, the front and middle femora, except tips, and the hind tibiæ brownish-piceous, the hind femora blue; flagellum brownblack. Wings hyaline, the veins yellowish.

Male.—Length 1.2 to 1.5 mm. Agrees well with the \mathcal{Q} in color and sculpture, except that the scape of the antennæ alone is yellow, the pedicel being æneous black. The abdomen is small, oval.

Brazil: Chapada, in April; Corumba, in May. Two female and two male specimens.

SYNTOMASPIS FLAVICOLLIS, sp. nov.

Female.—Length 2.6 mm.; ovipositor longer than the body. Bluish-green, the mesonotum posteriorly and the scutellum violaceous, the scape of antennæ, the prothorax, the legs, including coxæ, the tegulæ, venation of front wings, metapleura and the venter yellow or yellowish; the flagellum is brown-black; eyes very large, oval, brown. The head and the thorax are delicately shagreened, the scutellum with some sparse punctures beyond the apical cross-furrow. Wings hyaline, the veins pale yellowish.

Brazil: Chapada, in September. One female specimen.

Genus TORYMUS Dalman.

TORYMUS CUMELIS (Walker).

Callimome cumelis Walker, Ann. & Mag. Nat. Hist., X., 1842, p. 114, ♀.—Spinola, Gay: Hist. fis. Cuba, Zool., VI., 1851, p. 464.

2' To 11 m (2 / TT TT 1000 90)

Torymus cumelis Dalla Torre, Cat. Hym., V., 1898, p. 308.

Chile: Valparaiso (Walker).

TORYMUS NONACRIS (Walker).

Callimome nonacris Walker, Ann. & Mag. Nat. Hist., X., 1842, p. 113, ♀.—Spinola, Gay: Hist. fis. Chile, Zool., VI., 1851, p. 463, ♀.

Torymus nonacris Dalla Torre, Cat. Hym., V., 1898, p. 311.

Chile: Valparaiso, Walker; Brazil: Corumba, in April. One female specimen.

TORYMUS CHAPADÆ, sp. nov.

Female.—Length 2 mm.; ovipositor a little longer than the body. Head and thorax above greenish-blue, the pleura, metathorax, coxæ, femora and abdomen blue, the scape, tibiæ and tarsi yellowish, the flagellum brown-black, the ocelli pale, the eyes brown. The head, thorax and scutellum are shagreened. Wings hyaline, the tegulæ and veins pale yellowish. The abdomen is very short, higher than long, but this may be due to an accident.

Brazil: Chapada, highlands, in April. One female specimen.

TORYMUS SMITHI, sp. nov.

Female.—Length 3 mm.; ovipositor longer than the body. Blue, the head and thorax with a thimble-like punctuation, the tip of the scutellum smooth and

metallic green; the scape, tegulæ, veins and most of the legs, except the coxæ and the femora, are yellowish, the coxæ and the hind femora are blue, the front and middle femora above and basally are brownish.

Brazil: Chapada, in April; Para, in June. Two female specimens.

TORYMUS SYLVICOLA, sp. nov.

Female.—Length 8 mm.; ovipositor about the length of the body. Head and thorax metallic green, rather coarsely shagreened, the metathorax blue, the abdomen æneous, with a brownish shade; scape and pedicel yellowish, the flagellum light brown; legs, except the hind coxæ at basal two thirds which are metallic greenish, all brownish-yellow. Wings hyaline, the tegulæ and the veins pale yellowish.

Brazil: Chapada, in forests in April and October. Two specimens.

SUBFAMILY III. MONODONTOMERINÆ.

Genus MONODONTOMERUS Westwood.

Monodontomerus phormio (Walker).

Torymus phormio Walker, Ann. & Mag. Nat. Hist., X., 1842, p. 113, ♀.—Spinola, Gay: Hist. fis. Chile, Zool., VI., 1851, p. 466.—Dalla Torre, Cat. Hym., V., 1898, p. 311.

Monodontomerus phormio Walter, Notes on Chalc., II, p. 28.

Chile: Valparaiso.

Genus DIAMORUS Walker.

This genus should occur in South America, but I have seen no representatives of it in any of the collections examined by me. The species recorded and described by Dr. Mayr as *Diamorus* resemble genuine species very closely, but they really represent the females of Mayr's genus *Physothorax*.

Genus PHYSOTHORAX Mayr.

PHYSOTHORAX ANNULIGER Mayr.

Physothorax annuliger Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, p. 198, S.—Dalla Torre, Cat. Hym., V, 1898, p. 321.

Brazil: St. Catharina.

Physothorax biarticulatus (Mayr).

Nannocerus biarticulatus Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, p. 196, &.—Dalla Torre, Cat. Hym., V., 1898, p. 321.

Brazil: St. Catharina.

PHYSOTHORAX VARIABILIS (Mayr).

Diamorus variabilis Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, p. 228, ♀.
—Dalla Torre, Cat. Hym., V., 1898, p. 291.

Physothorax dorsiger Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV., 1885, p. 197 (wingless ♂).—Dalla Torre, Cat. Hym., V., 1898, p. 321.

PHYSOTHORAX MAYRI, sp. nov.

Female.—Length, 2.6 mm.; ovipositor about as long as the body. Similar to P. variabilis Mayr, but the punctures of the head and thorax are not so close, the scape and the pedicel being yellow, the prothorax being wholly blue, not all yellow or in part, as in P. variabilis, the femora, except at tips, being mostly blue, while the front wings have a brownish fascia beneath the stigmal vein, a character found in no other species.

Brazil.

Genus PLESIOSTIGMA Mayr.

PLESIOSTIGMA BICOLOR Mayr.

Plesiostigma bicolor Mayr, Verh. Zool.-bot. Gesell. Wien, XXXV, 1885, p. 227, &; Taf. XIII., f. 39, 40.—Dalla Torre, Cat. Hym., V., 1898, p. 316.

Brazil: Blumenau (Dr. Fritz Müller).

PLESIOSTIGMODES Ashmead, gen. nov.

This genus differs from all the other genera in the subfamily by the much swollen front femora, by the very long pronotum, which is longer than the mesonotum, and by the antennæ having *two* ring-joints.

PLESIOSTIGMODUS BRASILIENSIS, Sp. nov.

Female.—Length 1.5 mm. Head bluish æneous, with some minute punctures, the thorax more decidedly æneous, with a decidedly metallic greenish tinge on the mesonotum and on the scutellum, and with some sparse, minute punctures; the thickened front and hind femora are also more or less greenish, the rest of the legs, except the coxæ, and the scape of the antennæ being yellowish, the pedicel and the flagellum brown-black; the abdomen, except a bluish tinge basally, is æneous black; it is sessile, oblong and tapers off at apex, the first segment being the longest and having a slight median incision at apex. Wings hyaline, the tegulæ and veins pale yellowish.

Brazil: Corumba, lowland in May. One specimen.

HEMITORYMUS Ashmead, gen. nov.

This genus is allied to *Cryptopristus* Förster, but is easily separated by the hind femora being feebly serrate, *without* a distinct tooth, and by the venation in the front wings which agrees with *Torymus* and is quite different from *Cryptopristus*.

HEMITORYMUS THORACICUS, sp. nov.

Female.—Length 4 mm., ovipositor much longer than the body. Head and metathorax metallic greenish, the metapleura blue, the rest of the thorax, the antennal scape and pedicel, the legs, except the hind coxæ at base behind and the venter, yellow; the abdomen above is more or less tinged with brown; the flagellum is long brown-black. The head and the thorax are shagreened and have a shallow thimble-like punctuation. The metathorax is smooth with distinct spiracular sulci, the spiracles being large, oblong-oval. The wings are hyaline, with the tegulæ and the veins pale yellowish. The abdomen is oblong, as long as or a little longer than the head and the thorax united, and subcompressed along the venter basally.

Brazil: Chapada, in September. One specimen.

Subfamily V. Megastigminæ.

Genus MEGASTIGMUS Dalman.

I have seen a single specimen of this genus taken in Brazil not in good condition. It ought to be well represented in South America.

SUBFAMILY VI. ORMYRINÆ.

Genus ORMYRUS Westwood.

ORMYRUS BRASILIENSIS, sp. nov.

Female.—Length 1.7 mm. Blue; ocelli red; the extreme base of the scape, the trochanters, knees, tips of the tibiæ and the tarsi, pale yellowish, the rest of the tibiæ brownish piceous; wings hyaline, the veins light brownish.

The head and the thorax are almost smooth, but under a strong lens exhibit five transverse acciulations. The third body segment of the abdomen has two transverse rows of punctures at base, the fourth has three rows, the punctures on the fifth are large and arranged in about four rows, while the sixth has an indistinct row at the extreme base.

Brazil: Chapada, in April. One specimen. This is the first species to be described from South America.

Subfamily IV. Podagrioninæ.

Genus PODAGRION Spinola.

PODAGRION BRASILIENSIS Howard.

Podagrion brasiliensis Howard, Journ. Linn. Soc. London, Zool., XXV., 1896, p. 83, ♀.—Howard, Journ. Linn. Soc. London, Zool., XXVI., 1897, p. 132.—Dalla Torre, Cat. Hym., V., 1898, p. 369.

Brazil: Santarem; Chapada. West Indies: Grenada.

PODAGRION MELLEUS (Westwood).

Palmon melleus Westwood, Trans. Ent. Soc. London, IV., 1847, p. 260.

Podagrion melleus Walker, Notes on Chalc., Pt. 2, 1871, p. 28.—Dalla Torre, Cat. Hym., V., 1898, p. 369.

Brazil.

Host. Orthop.: eggs of Mantis brasiliana L.

PODAGRION CYANEUS, sp. nov.

Female. — Length about 3 mm. Blue (sometimes bronzed green above); the antennæ, except the club which is black, the legs, except the coxæ basally and the front and hind femora at basal two thirds which are blue, the abdomen along the venter and at apex, are yellowish. Wings hyaline, the tegulæ yellow, the veins light brown. The flagellum is long, strongly clavate, while the swollen hind femora are armed with from ten to twelve teeth.

Brazil: Santarem. One specimen.

Differs from *P. brasiliensis* Howard in color and by the more numerous teeth on the hind femora.

FAMILY LXII. CHALCIDIDÆ.

SUBFAMILY I. LEUCOSPIDINÆ.

Genus POLISTOMORPHA Westwood.

POLISTOMORPHA FASCIATA Westwood.

Polistomorpha fasciata Westwood, Thes. Ent. Oxon., 1874, p. 134; Pl. XXV., f. 3.—Dalla Torre, Cat. Hym., V., 1898, p. 405.

Brazil: Amazon.

POLISTOMORPHA SPHEGOIDES Walker.

Polistomorpha sphegoides Walker, Journ. Ent., I., 1860–61, p. 22.—Westwood, Thes. Ent. Oxon., 1874, p. 134; Pl. XXV., fig. 1.—Schletterer, Berlin. ent. Zeitschr., XXV., 1890, p. 297.—Dalla Torre, Cat. Hym., V., 1898, p. 405. Brazil.

POLISTOMORPHA SURINAMENSIS Westwood.

Polistomorpha surinamensis Westwood, Germar, Zeitsch. f. Entom., I., 1839, p. 265, \bigcirc .—Westwood, Thes. Ent. Oxon, 1874, p. 133; Pl. XXV., f. 2.—Schletterer, Berlin. ent. Zeitschr., XXV., 1890, p. 295.—Dalla Torre, Cat. Hym., V., 1898, p. 405.

Brazil: Surinam.

Genus LEUCOSPIS Fabricius.

LEUCOSPIS AFFINIS Say.

Leucospis affinis Say, Keating's Narrat. Exped., II., 1824, App., p. 327, ♀♂.—Leconte's Ed. Say's Works, I., 1859, p. 220.—Cresson, Trans. Am. Ent. Soc., IV., 1872, p. 32.—Provancher, Natur. Canad., XII., 1881, p. 268, ♀; fig. 12.—Provancher, Faun. ent. Can. Hym., 1883, p. 567; fig. 83.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, pp. 172, 175, 285.—Dalla Torre, Cat. Hym., V., 1898, p. 406.

Leucospis subnotata Westwood, Ent. Mag., II., 1834, p. 215, Q.—Westwood, Zeitschr. f. Ent., I., 1839, p. 250.

Leucospis fraterna Say, Journ. Bost. Soc. Nat. Hist., I., 1836, p. 269.—Leconte's Ed. Say's Works, I., 1859, p. 718.

Leucospis duræi Westwood, Zeitschr. f. Ent., I., 1839, p. 251, Q.

Leucospis basalis (Klug) Westwood, Zeitschr. f. Ent., I., 1839, p. 264.

Leucospis pœyi Guerin, Iconogr. régn. anim., VII., Ins., 1845, p. 414, ♀.—La Sagra's Hist. fis. Cuba, VII., 1850, p. 754.—Cresson, Proc. Ent. Soc. Phila., IV., 1865, p. 177.—Cresson, Trans. Am. Ent. Soc., IV., 1872, p. 32.

Leucospis canadensis Walker, Journ. Entom., I., 1860, p. 17.

Leucospis tapayosa Walker, Journ. Entom., I., 1860, p. 21. Brazil (*teste* Schletterer).

LEUCOSPIS CAYENNENSIS (Westwood).

Metallopsis cayennensis Westwood, Germar's Zeitschr. f. Entom., I., 1839, p. 264, ♂; T. 4, f. 4.

Leucospis mexicana Walker, Journ. Entom., I., 1860, p. 20, ♀.—Cresson, Trans. Am. Ent. Soc., IV., 1872, p. 30.—Cameron, Biol. Centr.-Amer. Hym., I., 1883, p. 76; Pl. 4, f. 11.

Leucospis tomentosa Kirby, Journ. Linn. Soc. London, Zool., XVII., 1882, p. 70, ♀. Leucospis cayennensis Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, pp. 172, 174 and 265; Pl. 6, f. 24.—Dalla Torre, Cat. Hym., V., 1898, p. 407. Brazil.

LEUCOSPIS COXALIS Kirby.

Leucospis coxalis Kirby, Ann. & Mag. Nat. Hist. (5), XV., 1885, p. 243, ♀.—Waterhouse, Aid Idend. Ins., Pt. XXVII., 1886; Pl. 169, f. 1, ♂.—Schletterer, Berlin. ent. Zeitschr., XXV., 1890, p. 271.—Dalla Torre, Cat. Hym., V., 1898, p. 407.

Argentina: Buenos Aires.

LEUCOSPIS CUPREOVIRIDIS Westwood.

Leucospis cupreoviridis Westwood, Thes. Ent. Oxon., 1874, p. 135; Pl. XXV., f. 5.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, p. 261.—Dalla Torre, Cat. Hym., V., 1898, p. 408.

New Grenada.

LEUCOSPIS DISTINGUENDA Schletterer.

Leucospis distinguenda Schletterer, Berlin. Ent. Zeitschr., XXXV., 1890, pp. 172 and 269, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 408.

Brazil.

LEUCOSPIS EGAIA Walker.

Leucospis egaia Walker, Journ. Entom., I., 1860, p. 20, ♀.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, p. 273.—Dalla Torre, Cat. Hym., V., 1898, p. 409. Brazil: Ega.

LEUCOSPIS HOPEI Westwood.

Leucospis hopei Westwood, Ent. Mag., II., 1834, p. 215, ♂.—Westwood, Germar's Zeitschr. f. Ent., I., 1839, p. 258; T. 2, f. 3.—Spinola, Gay: Hist. fis. Chile, Zool., VI., 1851, p. 470; T. 4, f. 3.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, pp. 171, 174 and 280; T. 6, f. 22.

Chile.

LEUCOSPIS IGNOTA Walker.

Leucospis ignota Walker, Journ. Entom., I., 1860, p. 22, J.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, p. 289.—Dalla Torre, Cat. Hym., V., 1898, p. 411.

Brazil?

LEUCOSPIS LEUCOTELUS Walker.

Leucospis leucotelus Walker, Ann. & Mag. Nat. Hist. (2), IX., 1852, p. 41, ♀.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, pp. 172 and 274.—Dalla Torre, Cat. Hym., V., 1898, p. 412.

Brazil: Para.

LEUCOSPIS PROPINQUA Schletterer.

Leucospis propinqua Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, pp. 171 and 277, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 413.

Brazil.

LEUCOSPIS SANTAREMA Walker.

Leucospis santarema Walker, Journ. Entom., I., 1860, p. 20, ♀.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, p. 279.—Dalla Torre, Cat. Hym., V., 1898, p. 413.

Brazil: Santarem.

LEUCOSPIS SPEIFERA Walker.

Leucospis speifera Walker, Journ. Entom., I., 1860, p. 21, ♀.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, p. 272.—Dalla Torre, Cat. Hym., V., 1898, p. 413.

Brazil: Ega.

LEUCOSPIS ENDERLEINI, sp. nov.

(Plate-XXXI., Fig. 1.)

Female.—Length 7 mm.; ovipositor short, not extending to the base of the third abdominal segment. Color dull bronze, the head in front and the pleura bronzy green, with whitish hairs; a streak at sides, along the front margin and along the hind margin of the pronotum, yellow or yellowish, another streak along the sides of the mesonotum and along its hind margin just in front of the scutellum, and a yellow band along the hind femora above and beneath, and along the outer face of the hind tibiæ.

The abdomen at the apex of the short second segment, the apex of the long third segment, and on the apical segments is metallic greenish and clothed with glittering white hairs.

Brazil: Santarem in March. One female. Named in honor of Dr. Günther Enderlein.

This species is allied to L. cayennensis Westw.

Genus EXOCHLÆNUS Shipp.

EXOCHLÆNUS ANTHIDIOIDES (Westwood).

Leucospis anthidioides Westwood, Thes. Ent. Oxon., 1874, p. 135; pl. 25, f. 7.—Schletterer, Berlin. ent. Zeitschr., XXXV., 1890, p. 257.

Exochlænus anthidioides Shipp, The Entom., XXVII., 1894, p. 245.—Dalla Torre, Cat. Hym., V., 1898, p. 404.

Brazil.

SUBFAMILY II. CHALCIDINÆ.

Tribe I. Chalcidini.

Genus PHASGONOPHORA Westwood.

PHASGONOPHORA BATESII Kirby.

Phasgonophora batesii Kirby, Journ. Linn. Soc. London, Zool., XVII., 1883, p. 74, ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 371.

Brazil: Santarem.

PHASGONOPHORA CAUDATA (Sichel).

Conura caudata Sichel, Blanchard, Hist. Nat. Ins., III., 1840, p. 256.

Chalcis caudatus Guérin, Iconogr. régn. Anim., VII., 1845, Ins., p. 413; tab. 67, f. 6.

Phasgonophora caudata Sichel, Ann. Soc. ent. France (4), V., 1865, pp. 358 and 371, ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 371.

Brazil.

PHASGONOPHORA CONDALUS Walker.

Phasgonophora condalus Walker, Entom., I., 1841, p. 134, ♀.—Sichel, Ann. Soc. ent. France (4), V., 1865, pp. 358 and 365.—Dalla Torre, Cat. Hym., V., 1898, p. 371.

Phasgonophora caudatus Guérin, Iconogr. régn. Anim., VII., 1845, Ins., p. 413 (def. typogr.).

Phasgonophora thoracica Sichel, Ann. Soc. ent. France (4), V., 1865, pp. 358 and 365. Brazil (Mr. Curtis' collection).

Genus TRIGONURA Sichel.

TRIGONURA DORSALIS, sp. nov.

Female.—Length 7.4 mm. Entirely black, except the pronotum, the mesonotum and the scutellum which are red, and the front and middle knees, tips of tibiæ, and all the tarsi which are yellow. Wings hyaline, the tegulæ yellow, the veins brown Brazil: Santarem. Three specimens.

TRIGONURA DENTIPES (Fabricius).

Chalcis dentipes Fabricius, Syst. Piez., 1804, p. 165.—Dalla Torre, Cat. Hym., V., 1898, p. 387.

South America.

Genus THAUMATELIA Kirby.

THAUMATELIA SEPARATA (Walker).

Chalcis separata Walker, Trans. Ent. Soc. London (3), I., 1862, p. 352, Q.

Thaumatelia separata Kirby, Journ. Linn. Soc. London, XVII., 1883, p. 60; pl. 4, f. 9, 10.—Dalla Torre, Cat. Hym., V., 1898, p. 372.

Brazil: Ega.

THAUMATELIA PULCHRIPENNIS, sp. nov.

(Plate XXXI., Fig. 2.)

Female.—Length 15 mm. Black; the abdomen, except the long stylus which is black, rufous; legs, except the hind femora which are rufous, black, the knees and tarsi, except the middle and hind pairs basally, honey-yellow. Wings with the apical half fuscous, the basal half yellowish and a large yellowish spot at tip of marginal vein, within the space formed by the postmarginal and stigmal veins. The seventh abdominal segment and the stylus basally are coarsely pitted or punctate. The antennæ are long, filiform, the first joint of the flagellum being longer

than the scape. The hind femora are armed with 7 moderate-sized teeth. The head and thorax, except the pronotum laterally, the middle lobe of the mesonotum and the mesopleura beneath the insertion of the front wings, which are smooth and shining, with only a few punctures, are closely punctate or sculptured.

Brazil: Chapada, Para, and Santarem. Five specimens.

Genus PSEUDOCHALCIS Kirby.

PSEUDOCHALCIS DECLARATOR (Walker).

Halticella declarator Walker, Trans. Ent. Soc. London (3), I., 1862, p. 360, ♀.
Pseudochalcis declarator Kirby, Journ. Linn. Soc. London, XVII., p. 61.—Dalla
Torre, Cat. Hym., V., 1898, p. 394.

Brazil: Ega.

PSEUDOCHALCIS CONICA Sp. nov.

Female.—Length 4.5–5 mm. Black, coarsely punctate, the tegulæ, tips of femora, the front tibiæ, except a black spot behind, middle and hind tibiæ, except a broad black annulus at the middle, and all tarsi sulphur yellow, the abdomen conically pointed, longer than the head and thorax united.

Brazil: Santarem, in March and May. Four specimens.

PSEUDOCHALCIS FLAVOPICTA, sp. nov.

Male.—Length 5.5 mm. Black, coarsely punctate, the front orbits, face below insertion of the antenne, scape, two large spots on dorsum of pronotum, a line on each side of the middle mesothoracic lobe, a spot on the outer front angle of the lateral lobes, a line on each side of the scutellum, the tegulæ, a line on the mesopleura, a large spot on the metapleura, a spot at apex of metanotum, a large spot on each side of second segment of abdomen, and the legs, except as noted, yellow, the hind coxæ with a large spot above at base, and a large spot on the disk of the hind femora, black.

Brazil: Corumba and Santarem. Three specimens.

Genus STYPIURA Kirby.

STYPIURA CONIGASTRA (Perty).

Chalcis conigastra Perty, Delect. anim. artic., 1834, p. 134; Pl. XXVI., f. 16.—Spinola, Mem. accad. sc. Torino (2), XIII., 1851, p. 44.

Europe; North and South America.

CHALCIS MNESTOR Walker.

Chalcis mnestor Walker, The Entom., I., 1841, p. 219.—Dalla Torre, Cat. Hym., V., 1898, p. 390.

Brazil.

CHALCIS ORSEIS Walker.

Chalcis orseis Walker, The Entom., I., 1842, p. 338, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 390.

Brazil (Mr. Shuckard's collection).

CHALCIS PRODUCTA Olivier.

Chalcis producta Olivier, Encycl. Méthod. Ins., V., 1790, p. 438.—Dalla Torre Cat. Hym., V., 1898, p. 391.

Brazil: Cayenne.

? CHALCIS QUADRIPUNCTATA Fabricius.

Chalcis quadripunctata Fabricius, Syst. Piez., 1804, p. 165.—Dalla Torre, Cat. Hym., V., 1898, p. 392.

Brazil.

? CHALCIS SERRIPES Fabricius.

Chalcis serripes Fabricius, Syst. Piez., 1804, p. 164.—Dalla Torre, Cat. Hym., V., 1898, p. 392.

Brazil (Mr. Shuckard's collection).

? CHALCIS SUBFASCIATA Holmgren.

Chalcis subfasciata Holmgren, Eugenies Resa, Ins., 1868, p. 436, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 393.

Argentina: Buenos Ayres.

CHALCIS TESTACEA Blanchard.

Chalcis testacea Blanchard, Hist. nat. Ins., III., 1840, p. 254.—Dalla Torre, Cat. Hym., V., 1898, p. 393.

Brazil: Cayenne.

CHALCIS VICARIA Walker.

Chalcis vicaria Walker, Journ. Ent., I., 1861, p. 183, —.—Dalla Torre, Cat. Hym., V., 1898, p. 393.

Brazil: Ega (Bates).

CHALCIS VILLOSA Olivier.

Chalcis villosa Olivier, Encycl. Méthod. Ins., V., 1790, p. 438.—Dalla Torre, Cat. Hym., V., 1898, p. 393.

St. Trinité.

TRIBE II. Smicrini.

Genus SMICRA Spinola.

Under this genus Dr. von Dalla Torre, in his Catalogus Hymenopterorum, has recorded about 200 species, described by Fabricius, Spinola, Walker and others, but of this number scarcely a dozen belong to *Smicra* Spinola, as restricted by Thomson and accepted by Howard and the writer; the vast majority belong to *Spilochalcis* Thomson, but many others fall into other genera characterized in this work.

SMICRA CLAVATA (Fabricius.)

Chalcis clavata Fabricius, Syst. Piez., 1804, p. 162.—Dalla Torre, Cat. Hym., V., 1898, p. 387.

Brazil.

Genus EPITRANUS Walker.

EPITRANUS FULVESCENS Walker.

Epitranus fulvescens Walker, Ent. Mag., II., 1834, p. 26.—Kirby, Journ. Linn. Soc. London, Zool., XVII., 1883, p. 55; pl. 3, f. 6 and 7.—Dalla Torre, Cat. Hym., V., 1898, p. 383.

West Indies: St. Vincent; South America: Brazil.

EUSTYPIURA Ashmead, gen. nov.

Allied to *Spilochalcis*, but easily separated by the abdominal differences, the eighth segment being greatly lengthened into a compressed stylus, as in *Stypiura* Kirby.

EUSTYPIURA BICOLOR, sp. nov. (Plate XXXI., Fig. 4.)

Female.—Length 9.5–10 mm. Pale honey-yellow; eyes green; the pedicel and the first three or four basal joints of the flagellum, the middle and hind coxe, tips of their tibiæ, middle tarsi, hind trochanters, basal half of hind femora, and the abdomen, except the stylus and sometimes the seventh segment, black, Wings hyaline, tinged with yellowish toward base, the veins light brownish. The hind femora are armed with one moderately large tooth, followed by about fourteen minute teeth.

Male.—Length 7 mm. Agrees well with the female, except that there is a dusky median streak on the mesonotum posteriorly and the abdomen is ovate, without a stylus.

Brazil: Santarem, in April; Chapada, in March and April. Described from five females and two males.

EUSTYPIURA SEXMACULATA, sp. nov.

(Plate XXXI., Fig. 6.)

Female.—Length 9–10 mm. General color pale honey-yellow; pedicel and four or five basal joints of the flagellum, the occiput, a spot on the anterior face of the pronotum, the middle lobe of the mesonotum, except along the parapsidal furrows, the inner margins of the lateral lobes, the axillæ and base of scutellum, the apex of scutellum, tips of hind femora, a spot at apex of hind femora beneath, and the base and apex of hind tibiæ, black; the abdomen has some faint transverse brownish bands. Wings hyaline. The hind femora are armed with one moderate-sized tooth at base, followed by sixteen or seventeen minute teeth.

Brazil: Santarem; Maruru; Para. Three specimens. The specimen from Maruru has the basal half of the hind femora black; while that from Para has a spot at base and the apex of the stylus black.

EUSTYPIURA SMITHII, sp. nov.

Female.—Length 12 mm. Pale honey-yellow; the pedicel and the flagellum are brown-black, paler beneath at apex; two triangular black spots on the middle mesothoracic lobe anteriorly, and two faint streaks behind these; the lateral lobes have a black spot on the inner margins; the scutellum has a narrow transverse band at base and its tip black; while the hind femora have a black spot at apex beneath. Wings hyaline, the veins yellowish. The abdomen has the segments two to seven faintly brownish at apex. The hind femora are armed with one large long tooth at base followed by about nine or ten small teeth, the small teeth tipped with black.

Brazil: Santarem. One specimen.

Genus SPILOCHALCIS Thomson.

SPILOCHALCIS ABDOMINALIS (Walker).

Smiera abdominalis Walker, Journ. of Ent., I., 1861, p. 177, 3.

Smicra ambigua Cresson, Trans. Am. Ent. Soc., IV., 1872, p. 44, 3.

Smicra abdominalis Cresson, Trans. Am. Ent. Soc., IV., 1872, p. 57, ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 372.

Mexico: Orizaba (Sallé); South America: Brazil.

SPILOCHALCIS ACCILA (Walker).

Smiera accila Walker, the Entom., I., 1841, p. 218.—Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Shuckard's collection).

SPILOCHALCIS ACUTA (Fabricius).

Chalcis acuta Fabricius, Syst. Piez., 1804, p. 161.—Dalla Torre, Cat. Hym., V., 1898, p. 385.

Brazil.

SPILOCHALCIS ADJUNCTA (Walker).

Smiera adjuncta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 189, J.

Smicra adjuncta Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Bates).

SPILOCHALCIS ADMIXTA (Walker).

Smiera admixta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 189, Q.

Smicra adjuncta Dalla Torre, Cat. Hym., V., 1898, p. 373.

Genus SPILOCHALCIS Thomson.

SPILOCHALCIS ÆMULA (Walker).

Smiera æmula Walker, Trans. Ent. Soc. London (3), II., 1864, p. 192, ♀. Smicra æmula Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Bates).

SPILOCHALCIS ÆQUALIS (Walker).

Smiera æqualis Walker, Trans. Ent. Soc. London (3), II., 1864, p. 200, &. Smiera æqualis Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Bates).

SPILOCHALCIS AFFICTA (Walker).

Smiera afficta Walker, Trans. Ent. Soc. London (3), II., p. 184, 3.

Smicra afficta Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Bates).

SPILOCHALCIS ALIENATA (Walker).

Smiera alienata Walker, Trans. Ent. Soc. London (3), II., 1864, p. 195, Q.

Smicra alienata Dalla Torre, Cat. Hym., V., 1898, p. 393.

Brazil (Mr. Bates).

SPILOCHALCIS ANNEXA (Walker).

Smiera annexa Walker, Trans. Ent. Soc. London (3), II., 1864, p. 204, Q.

Smicra annexa Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Bates).

SPILOCHALCIS ANNULIFERA (Walker).

Smiera annulifera Walker, Trans. Ent. Soc. London (3), II., 1864, p. 202, ♀.

Smicra annulifera Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Bates).

SPILOCHALCIS APPARATA (Walker).

Smiera apparata Walker, Trans. Ent. Soc. London (3), II., 1864, p. 186, Q.

Smicra apparata Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Bates).

SPILOCHALCIS APPRESSA (Walker).

Smiera appressa Walker, Trans. Ent. Soc. London (3), II., 1864, p. 186, Q.

Smicra appressa Walker, Dalla Torre, Cat. Hym., V., 1898, p. 373.

Brazil (Mr. Bates).

SPILOCHALCIS ATTACTA (Walker).

Smiera attacta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 206, Q.

Smicra attacta Dalla Torre, Cat. Hym., V., 1898, p. 373.

SPILOCHALCIS BERGII (Kirby).

Smicra (?) bergii Kirby, Ann. & Nat. Hist. (5), XV., 1885, p. 244, ♀ ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 373.

Uruguay.

SPILOCHALCIS BLANDA (Walker).

Smiera blanda Walker, Trans. Ent. Soc. London (3), II., 1864, p. 199, Qd.

Smicra blanda Dalla, Torre, Cat. Hym., V., 1898, p. 374.

Brazil (Mr. Bates).

SPILOCHALCIS BURMEISTERI (KIRBY).

Smicra burmeisteri Kirby, Journ. Linn. Soc. London, Zool., XVII., 1883, p. 73.—Kirby, Ann. & Mag. Nat. Hist. (5), XV., 1885, p. 243.—Dalla Torre, Cat. Hym., V., 1898, p. 243.

Brazil: St. Paulo; Argentine.

SPILOCHALCIS CAPITULATA (Costa).

Smiera capitulata Costa, Ann. Mus. Zool. Napoli, II. (1862), 1864, p. 68, 3.

Smicra capitulata Dalla Torre, Cat. Hym., V., 1898, p. 374.

Brazil.

SPILOCHALCIS CELSA (Walker).

Smiera celsa Walker, Trans. Ent. Soc. London (3), II., 1864, p. 201, 3.

Smicra celsa Dalla Torre, Cat. Hym., V., 1898, p. 374.

Brazil (Mr. Bates).

SPILOCHALCIS COGNATA (Walker).

Smiera cognata Walker, Trans. Ent. Soc. London (3), II., 1864, p. 204, \(\varphi \).

Smicra cognata Dalla Torre, Cat. Hym., V., 1898, p. 374.

Brazil (Mr. Bates).

SPILOCHALCIS COMPOSITA (Walker).

Smiera composita Walker, Trans. Ent. Soc. London (3), II., 1864, p. 188, \(\psi \).

Smicra composita Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil (Mr. Bates).

SPILOCHALCIS CONGRUA (Walker).

Smiera congrua Walker, Journ. Ent., I., 1861, p. 176, Q.

Smicra congrua Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil: Santarem (Bates).

SPILOCHALCIS CONTRACTA (Walker).

Smiera contracta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 184, Q.

Smicra contracta Dalla Torre, Cat. Hym., V., 1898, p. 375.

SPILOCHALCIS CONTRIBUTA (Walker).

Smiera contributa Walker, Trans. Ent. Soc. London (3), II., 1864, p. 201, Smiera contributa Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil (Mr. Bates).

SPILOCHALCIS COSTALIS (Walker).

Smiera costalis Walker, Journ. Ent., I., 1861, p. 174, Q.

Smicra costalis Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil: Para.

SPILOCHALCIS DARES (Walker).

Smiera dares Walker, The Entom., I., 1842, p. 338, \(\varphi \).

Smicra dares Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil (Mr. Shuckard's collection).

(?) SPILOCHALCIS DECIPIENS (Kirby).

Smiera decipiens Kirby, Journ. Linn. Soc. London, Zool., XVII., 1883, p. 73.—Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil: Villa Nova, Amazon.

SPILOCHALCIS DECISA (Walker).

Smiera decisa Walker, Journ. Ent., I., 1861, p. 176, J.

Smicra decisa Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil: St. Paulo.

SPILOCHALCIS DEDUCTA (Walker).

Smiera deducta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 206, Q.

Smicra deducta Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil (Mr. Bates).

SPILOCHALCIS DEFUNCTA (Walker).

Smiera defuncta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 189, Q.

Smicra defuncta Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil (Mr. Bates).

SPILOCHALCIS DEMONSTRATA (Walker).

Smiera demonstrata Walker, Journ. Ent., I., 1861, p. 175, ♀.

Smicra demonstrata Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil: Villa Nova (Bates).

SPILOCHALCIS DEMOTA (Walker).

Smiera demota Walker, Trans. Ent. Soc. London (3), II., 1864, p. 205, Q.

Smicra demota Dalla Torre, Cat. Hym., V., 1898, p. 376.

SPILOCHALCIS DEPICTA (Walker).

Smiera depicta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 203, Q.

Smicra depicta Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil (Mr. Bates).

SPILOCHALCIS DESCRIPTA (Walker).

Smiera descripta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 197, Q.

Smicra descripta Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil (Mr. Bates).

SPILOCHALCIS DETRACTA (Walker).

Smiera detracta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 202, 3.

Smicra detracta Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil (Mr. Bates).

SPILOCHALCIS DIMOTA (Walker).

Smiera dimota Walker, Trans. Ent. Soc. London (3), II., 1864, p. 196, Q.

Smicra dimota Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil (Mr. Bates).

SPILOCHALCIS DISCALIS (Walker).

Smiera discalis Walker, Journ. Ent., I., 1861, p. 178, Q.

Smicra discalis Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil: Ega (Mr. Bates).

SPILOCHALCIS DISCOLOR (Walker).

Smiera discolor Walker, Journ. Ent., I., 1861, p. 180, \(\varphi \).

Smicra discolor Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil: St. Paulo (Mr. Bates).

SPILOCHALCIS DISPOSITA (Walker).

Smiera disposita Walker, Trans. Ent. Soc. London (3), II., 1864, p. 196, Q.

Smicra disposita Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil (Mr. Bates).

SPILOCHALCIS ENYO (Walker).

Smiera enyo Walker, The Entom., I., 1841, p. 133, $\mathcal{P} \mathcal{J}$.

Smicra enyo Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil (Mr. Curtis' collection).

SPILOCHALCIS EXHAURIENS (Walker).

Smiera exhauriens Walker, Trans. Ent. Soc. London (3), II., 1898, p. 198, Q.

Smicra exhauriens Dalla Torre, Cat. Hym., V., 1898, p. 376.

SPILOCHALCIS EXPLETA (Walker).

Smiera expleta Walker, Trans. Ent. Soc. London (3), II., 1864, p. 197, Q.

Smicra expleta Dalla Torre, Cat. Hym., V., 1898, p. 376.

Brazil (Mr. Bates).

SPILOCHALCIS FLAVA (Fabricius).

Chalcis flava Fabricius, Syst. Piez., 1804, p. 261.—Dalla Torre, Cat. Hym., V., 1898, p. 388.

South America: Brazil.

SPILOCHALCIS ANDRÉI Ashmead, n. n.

Smicra flavescens André, Ann. Soc. Ent. France (6), I., 1881, p. 343.—Dalla Torre, Cat. Hym., V., 1898, p. 377.

Guiana.

SPILOCHALCIS FOVEATA (Kirby).

Smicra foveata Kirby, Journ. Linn. Soc. Zool., XVII., 1883, p. 71, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 377.

Brazil: Amazon.

SPILOCHALCIS GHILIANII (Spinola).

Smicra ghilianii Spinola, Mem. accad. sc. Torino (2), XIII., 1851, p. 46, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 377.

Brazil.

SPILOCHALCIS GRACILIS (Kirby).

Smicra gracilis Kirby, Ann. & Mag. Nat. Hist. (6), IV., 1889, p. 143.—Dalla Torre, Cat. Hym., V., 1898, p. 377.

Brazil: Theresopolis.

SPILOCHALCIS ILLATA (Walker).

Smiera illata Walker, Trans. Ent. Soc. London (3), I., 1862, p. 348, 8.

Smicra illata Dalla Torre, Cat. Hym., V., 1898, p. 377.

Brazil: Ega.

SPILOCHALCIS INCERTA (Kirby).

Smicra incerta Kirby, Journ. Linn. Soc. Zool., XVII., 1883, p. 72.—Dalla Torre, Cat. Hym., V., 1898, p. 377.

Brazil: Amazon.

SPILOCHALCIS LANCEOLATA (Walker).

Smiera lanceolata Walker, Journ. Ent., I., 1861, p. 174, Q.

Smicra lanceolata Dalla Torre, Cat. Hym., V., 1898, p. 378.

Brazil: Santarem (Mr. Bates).

SPILOCHALCIS LEPREURII (Spinola).

Smicra lepreurii Spinola, Ann. Soc. Ent. France, IX., 1840, p. 98, J.—Dalla Torre, Cat. Hym., V., 1898, p. 378.

Brazil: Cayenne.

SPILOCHALCIS LOBATA (Costa).

Smiera lobata Costa, Ann. mus. zool. Napoli, II. (1862), 1864, p. 68.

Smicra lobata Dalla Torre, Cat. Hym., V., 1898, p. 378.

? Brazil.

? SPILOCHALCIS LUTEIPENNIS (Walker).

Smiera luteipennis Walker, Journ. Ent., I., 1861, p. 172, \mathcal{D} .

Smicra luteipennis Dalla Torre, Cat. Hym., V., 1898, p. 378.

Brazil.

SPILOCHALCIS MULTINOTATA (Costa).

Smiera multinotata Costa, Ann. mus. zool. Napoli, II. (1862), 1864, p. 68, Q.

Smicra multinotata Dalla Torre, Cat. Hym., V., 1898, p. 379.

? Brazil.

SPILOCHALCIS NEBULOSA (Walker).

Smiera nebulosa Walker, Journ. Ent., I., 1861, p. 180, Q.

Smicra nebulosa Dalla Torre, Cat. Hym., V., 1898, p. 380.

Brazil: Ega (Mr. Bates).

? Spilochalcis nigricornis (Fabricius).

Chalcis nigricornis Fabricius, Ent. Syst. Suppl., 1798, p. 243.—Fabricius, Syst. Piez., 1804, p. 163.—Jurine, Nouv. Méth. Class. Hym., 1807, p. 316, ♀♂.

Smicra nigricornis Cresson, Trans. Am. Ent. Soc., IV., 1872, p. 57.—Dalla Torre, Cat. Hym., V., 1898, p. 380.

Brazil.

SPILOCHALCIS OBLITERANS (Walker).

Smiera obliterans Walker, Journ. Ent. I., 1861, p. 175, ♀ ♂.

Smicra obliterans Dalla Torre, Cat. Hym., V., 1898, p. 380.

Brazil: Santarem.

SPILOCHALCIS PEIROLERII (Spiuola).

Smiera peirolerii Spinola, Ann. Mus. Hist. Nat., XVII., 1811, p. 147 (s. descrip.). Smiera peirolerii Dalla Torre, Cat. Hym., V., 1898, p. 386.

Brazil.

SPILOCHALCIS PERA (Kirby).

Smicra pera Kirby, Journ. Linn. Soc. London, Zool., XVII., 1883, p. 72.—Dalla Torre, Cat. Hym., V., 1898, p. 381.

Brazil.

SPILOCHALCIS PICTA (André).

Smicra picta André, Ann. Soc. ent. France (6), I., 1881, p. 341, ♀.—Dalla Torre, Cat. Hym , V., 1898, p. 381.

? Brazil.

SPILOCHALCIS PIELUS (Walker).

Smiera pielus Walker, Ent. Mag., V., 1838, p. 470, Q.

Smicra pielus Dalla Torre, Cat. Hym., V., 1898, p. 381.

Brazil: Rio de Janeiro.

SPILOCHALCIS PYGMÆA (Fabricius).

TABLE OF NEW SPECIES.

	TABLE OF NEW SPECIES.
1.	Thorax yellow or mostly yellow
	Thorax black or mostly black, or red.
	Mesonotum entirely black
	Mesonotum not entirely black
2.	Dorsum of pronotum entirely yellow
	Dorsum of pronotum not entirely yellow.
	Hind margin of pronotum with a yellow line on each side; clypeus except anteriorly, the front
	and hind orbits, all tarsi, and a line on each side of the scutellum, yellow; abdomen black
	with only the petiole yellow, \circ
	Hind margin of pronotum entirely yellow; head entirely black; lateral mesothoracic lobes with
	a yellow spot in front of the tegulæ; scutellum with a yellow line across the base; abdomen
	entirely black, φ
3.	Middle mesothoracic lobe entirely black
	Middle mesothoracic lobe not entirely black, either margined with yellow or with minute yellow or red-
	dish dots or spots, sometimes red or red in part
4.	Front orbits, a spot on hind orbits below, the scape, the apical half of scutellum, except the apical ridge,
	the legs, except a large spot on hind femora above at apex and their tarsi, yellow; lateral mesothoracic
_	lobes and the axillæ black; abdomen with the basal half or more ferruginous, \circ S. santaremensis.
5.	Thorax above not red
	Thorax above red or red for the greater part.
	Hind coxe black. 6
C	Hind coxæ ferruginous or yellow, but sometimes with a black spot or line
0.	legs and the long petiole of abdomen, yellow; body of abdomen rufous; hind femora and tibiæ
	ferruginous, φ ,
7	Head normal, seen from in front not wider than long
	Head abnormal, seen from in front much wider than long.
	Thorax, except the sutures, red, the pronotum with a yellowish tinge; scape, front and middle
	legs, yellow, the middle femora toward apex and the tibiæ toward base brownish, the hind
	femora dusky at middle; abdomen red, φ
8.	Thorax not mostly red
	Thorax mostly red
9.	Thorax, except the middle mesothoracic lobe posteriorly and the metathorax which are black, red;
	base of antennæ and the legs yellow; abdomen yellowish, the petiole black, \circ S. nigropetiolata.
	Thorax, except the middle mesothoracic lobe posteriorly, the lateral lobes and the scutellum which
	are red, black; head black; front and middle legs yellow; hind femora black; hind tibiæ and
	tarsi and the long abdominal petiole, yellow, Q
10.	Thorax, except the middle mesothoracic lobe posteriorly and the metathorax which are black, red;
	legs yellow; abdomen pale ferruginous, the petiole black

	Thorax above wholly red, the pleura and metathorax black; head black; scape, front and middle legs and the abdomen at base pale yellowish; hind legs, except tarsi, pale ferruginous, \circ . S. flavobasalis.
11	Thorax above mostly black, without small yellow or reddish dots, the lobes margined with yellow. 12
11.	
	Thorax above mostly black, but the dorsum with many small yellow or reddish dots.
	Legs mostly black, the knees of front and middle legs, the base and apex of tibiæ, and all tarsi,
	yellow; abdomen black with two transverse white lines at apex of the second dorsal seg-
	ment, ♀
12.	Hind coxæ mostly black or black with yellow stripes
	Hind coxe not mostly black; mesothoracic lobes margined with yellow
10	Hind coxe with a yellow spot at base above or striped black and yellow
15.	
	Hind coxe without a yellow spot at base. Head, except the front orbits, black; thorax black with a
	line on each side of the middle mesothoracic lobe and two large spots on the scutellum, yellow;
	hind femora with a spot at apex, the front and middle legs except the coxæ, the hind tarsi and the
	petiole of the abdomen, yellow, &
14.	Vertex with no irregular yellow marks, otherwise similar to S. flavopetiqlata, except that the scutellum
	has two oblong yellow spots, one on each side, the metanotum and the mesopleura being im-
	maculate
	Vertex with irregular yellow marks, or the ocelli margined with yellow; front orbits, clypeus, a line on
	each side of the middle mesothoracic lobe, a spot on the lateral lobes, two oblong spots at base of
	scutellum nearly confluent, two spots on metanotum, a spot on mesopleura beneath the tegulæ and
	a small spot in front of it, and the legs, except the coxæ, the base of front and middle femora
	beneath, and most of hind legs which are black, yellow; the hind coxæ have a yellow spot at base
	above connected with a long yellow stripe beneath; hind femora margined with yellow at base and
	above, and also with a yellow spot outwardly near the apex; hind tibiæ with a yellow line outwardly
	extending from near the base to the apex
15.	Front wings maculate, or with a fuscous spot or cloud from the tip of the stigmal vein 16
	Front wings immaculate, or without a fuscous spot or cloud from the tip of the stigmal vein 21
16	Head not entirely yellow, the occiput and the scrobes or the middle of the face black
10.	Head entirely yellow
17.	Scutellum mostly yellow with a central black spot; if black margined with yellow, the axillæ never
	wholly black, the ridge or plate at apex entire
	Scutellum mostly black with two large yellow spots nearly confluent at apex, the axillæ wholly black,
	the ridge at apex emarginate; front and middle legs yellow, &
18.	All legs entirely yellow, except a spot, sometimes faint or nearly obsolete, on hind coxæ above 19
	Front and middle legs entirely yellow, the hind legs marked with black, the coxe more or less black
	above, φ
10	Abdomen fusiformly pointed and yellow, except the sheaths of the ovipositor which are black.
19.	
	All mesothoracic lobes black margined with yellow; scutellum yellow with a large central black
	spot; mesopleural furrow black; hind cox α with a distinct black spot, φ
	Not all of the mesothoracic lobes black margined with yellow, the lateral lobes being wholly
	yellow; spot on hind coxæ nearly obsolete, ♀
20.	Thorax mostly yellow with the sutures, a median stripe or line on the middle mesothoracic lobe pos-
	teriorly and on the scutellum, black; all legs yellow; abdomen as in S. imitator, \circ S. simillima.
	Thorax mostly yellow but with the middle mesothoracic lobe anteriorly and the tip of the metathorax

	dusky or black, the scutellum entirely yellow; all legs yellow but the hind coxe above ferruginous
	or blackish at apex; abdomen ferruginous, the petiole long, blackish at base, the body oblong oval,
21.	tinged with fuscous or blackish at sides towards apex, \circlearrowleft
	Thorax entirely yellow, immaculate
22.	Middle mesothoracic lobe yellow with two small black spots or short lines on the anterior margin and
	a black spot posteriorly
	Middle mesothoracic lobe quite differently marked. 23
23.	Middle mesothoracic lobe with a large triangular black spot, or black with the sides and the base (the
	part near the scutellum) margined with yellow or white (the black sometimes with a yellow central
	spot)
	Middle mesothoracic lobe with one or more black lines, or with a central black spot
24.	Middle mesothoracic lobe margined with yellow
	Middle mesothoracic lobe margined with white.
	Head, except the scrobes and the occiput, the pronotum above, the outer margins of the lateral
	mesothoracic lobes, two large spots on the scutellum, a line on each side of the metathorax
	and the front and middle legs white or yellowish-white
25.	Hind coxe not mostly black, either ferruginous or yellow, but sometimes spotted or striped with black.
	26
	Hind coxe nearly wholly black, or at most with a yellowish spot at base above or below; body of
	abdomen rufous or pale ferruginous, the petiole yellow.
	Hind coxæ black except a spot at base beneath; mesothoracic lobes mostly red margined with
	yellow; pleura black, ♀
	Hind coxe black except a spot at base above; mesothoracic lobes black margined with yellow;
	abdomen red
26.	Hind coxæ striped longitudinally with black or yellow and black
	Hind coxe not so marked, at the most with only a black spot, but frequently immaculate, except at the
	extreme apex
27.	Lateral mesothoracic lobes along the outer and basal margins yellow; scutellum black with a yellow
	band across the base, the axillæ wholly yellow, except a delicate black line at base; hind femora
	mostly yellow with a leg of mutton shaped black spot extending from the base to near the middle,
	and a curved black line toward apex; abdomen black and yellow, the petiole, base of the second,
	third and fourth dorsal segments black, \circ
	Lateral mesothoracic lobes with an oblique yellow spot on the outer basal angle; scutellum with two
	spots at base and its apex yellow, the axillæ wholly black; hind femora mostly black marked with
	yellow at base and above and with a curved yellow line outwardly at apex; abdomen yellow and
	black banded, the petiole yellow? S. flavoorbitalis.
28.	All coxe yellow, immaculate, except sometimes the hind coxe at the extreme apex
	All coxe not yellow, immaculate, the hind coxe maculate or at least dusky at base or at apex or with
	a large black spot
29.	Head not entirely yellow, the occiput and the scrobes, or the middle of the face, black 30
	Head entirely yellow
30.	Middle mesothoracic lobe margined with yellow and with a small yellow spot in the black before the
	middle, the lateral lobes margined with yellow outwardly; scutellum margined all around with yel-
	low, the axillæ with a yellow spot behind; dorsum of pronotum yellow with a small black spot on

	each side, meso- and metapleura marked with yellow; hind femora yellow with four black spots on the outer face and one small spot on the inner face; abdomen short ovate, the petiole about four times as long as thick, the segments 3 to 8 at sides banded with black or fuscous
31.	Face with a long acute tubercle between the insertion of the antennæ, yellow, a large triangular black spot on middle mesothoracic lobe, the outer margins of the lateral lobes, mesopleura, and spot on metanotum black; abdomen pale ferruginous; \circ
32.	Middle mesothoracic lobe with a large triangular black spot or black with the sides and the base (the part nearest the scutellum) yellow, the lateral lobes also margined outwardly with yellow 33 Middle mesothoracic lobe with one or more black lines, the lateral lobes usually immaculate 44
33.	Scutellum yellow with a central black line or spot, the axillæ not entirely black, usually yellow with a black spot
	Scutellum yellow with a large quadrate black spot at base, the axillæ black.
	Scutellum at apex emarginate or bidentate; hind femora marked with black; their tibiæ bian-
	nulate with black; abdomen conic-ovate, the petiole not more than thrice as long as thick. S. bidentata.
34.	Occiput and the vertex yellow, the scrobes always yellow
	The triangular black spot on the middle mesothoracic lobe without a central yellow spot 35
	The triangular black spot on the middle mesothoracic lobe with a central yellow spot 39
35.	Mesopleural furrow (the femoral furrow of the mesopleura) black
	Mesopleural furrow not black
36.	Hind femora outwardly with a large broad black spot near the base, a small black spot at apex and
	another above it on the upper margin; abdomen subglobose, the petiole about four times as long as thick
	Hind femora immaculate, except a black spot within near upper margin; abdomen oblong oval,
	faintly tinged with piceous, the petiole three times as long as thick (3), in female long fusiform or
	lanceolate, the petiole short, transverse
97	Hind coxe with a black stripe or spot above.
οι.	Hind coxe immaculate.
	Hind femora with a large black spot on upper margin within; scutellum yellow with a median
	black line
	Hind femora immaculate; abdomen fusiformly pointed, some of the dorsal segments banded
	with fuscous, the petiole four times as long as thick; Q ; scutellum with a large black spot
	on the disk
	No new species fall in here.
39.	Meso- and meta-pleura yellow, except sometimes a black spot in the femoral furrow 40
	Meso- and meta-pleura, except a spot beneath the insertion of the wings, black.
	Hind coxe black at apex, the hind femora yellow with a large black spot across from the large
	basal tooth and another smaller spot at apex, the hind femora with a black annulus at base;
	body of abdomen short, dusky above; \bigcirc
40.	Hind femora immaculate
	Hind femora with one or two black spots.
	Hind femora with two black spots; abdomen short ovate, shorter than the head and thorax
	united, the petiole about thrice as long as thick; \circ
	Hind femora with one black spot; abdomen oval, the petiole only twice as long as thick; δ . S. corumbicola.

41.	Abdomen in \mathcal{P} long, fusiformly pointed, longer than the head and thorax united, the petiole very short, wider than long, in \mathcal{P} not longer than the thorax, the petiole thrice as long as thick. S. mülleri.
	Abdomen in Q fusiform, but not longer than the head and thorax united, the petiole nearly thrice as
	thick, in one obling-oval
49	
42.	Front face of pronotum immaculate. 48
	Front face of pronotum with a median black spot.
	Mesopleura entirely yellow; ♂S. mülleri.
43.	Hind coxæ with a black spot at base beneath; mesopleural furrow and a spot on each side of the metan o-
	tum black; abdomen fusiform, more or less reddish, the dorsal segments banded with black or
	fuscous, the petiole black and about thrice as long as thick
44.	Middle mesothoracic lobe with a small central black spot or with two black spots anteriorly 80
	Middle mesothoracic lobe not so marked.
	Middle mesothoracic lobe with a central black line its entire length or nearly so
	Middle mesothoracic lobe without a central black line, but with two lines anteriorly, or these
	lines are united and form a loop, which is sometimes connected with a short median black
	line from the base of the scutellum
45.	Parapsidal furrows or sutures <i>not</i> black
	Parapsidal furrows or sutures black.
	Hind coxe immaculate or with only a black spot above, or the extreme apex black, never
	striped longitudinally with black
	Hind coxe striped longitudinally with black
46	Hind coxe with a black stripe both above and beneath: metathorax with a central black spot; abdo-
10.	men subglobose, banded with black or fuscous above, the petiole a little more than twice longer than
	thick. S. insularis.
	Hind coxe with a black stripe above only; metathorax dusky medially; abdomen conically produced,
	the dorsum banded with black, the petiole not quite twice as long as thick
47.	Hind coxæ immaculate except sometimes at apex
	Hind coxe with a large black spot above.
	Hind femora with two black spots, one near the middle and one at the apex; mesopleural furrow black; body of abdomen subglobose; faintly banded, the petiole about thrice as long as thick
	Hind femora immaculate; a small spot on each lateral mesothoracic lobe; abdomen elongate
	lanceolate, much longer than the head and thorax united, the petiole very short, transverse. S. mayri.
48.	Mesopleura marked with black; middle mesothoracic lobe with a central black line 49
	Mesopleura immaculate
40	Hind femora maculate
	Hind femora immaculate
50	
ъU.	The central black line on the middle mesothoracic lobe not or only slightly dilated at the middle 51
	The central black line on the middle mesothoracic lobe dilated at the middle; hind femora with a spot
	at base beneath and a spot at apex beneath black; abdomen conic-ovate, the petiole more than thrice
	longer than thick.
	Hind tibiæ without a median black band
	Hind tibiæ with a median black band

51. Hind femora with a black spot at apex beneath but not at base; abdomen conic ovate, the petiole
scarcely thrice as long as thick
Hind femora with a black spot at base and a black spot at apex; abdomen fusiformly pointed, the
petiole about twice as long as thick; Q
52. Abdomen conic-ovate, the petiole about thrice as long as thick; legs immaculate
53. Abdomen fusiformly produced, longer than the head and thorax united, the petiole very short, wider
than long
54. Lateral mesothoracic lobes immaculate
Lateral mesothoracic lobes maculate, or with a black spot or line; front face of pronotum usually with
a median black spot, variable in size, sometimes very minute but rarely entirely wanting.
Scutellum with a central black line or spot and also with a black line across the base or in the
basal suture; sometimes with a large black spot at apex
Scutellum without a central black line or spot
55. Hind coxæ immaculate, except sometimes at apex 56
Hind coxe with a black spot above toward base.
Hind femora with a black spot at apex
56. Hind tibiæ outwardly entirely yellow
Hind tibiæ outwardly more or less fuscous or black, not entirely yellow
57. Hind tibiæ black or fuscous with a broad yellow band before the middle; hind femora with three
black spots
Hind tibie black or fuscous at the apical third, yellow basally; hind femora with a black spot at apex
beneath; axillæ black; scutellum with a large oval spot towards apex; abdomen conic-ovate, the
petiole about five times as long as thick; eyes very large, occupying the whole sides of the head.
S. axillaris.
58. Hind femora with a black spot at apex
58. Hind femora with a black spot at apex
Hind femora immaculate.
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a trans-
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly. Scutellum without a central black line, the apex with a transverse black spot; middle mesothoracic lobe with two triangular black spots anteriorly. S. marshalli. Middle mesothoracic lobe with a club-shaped central black spot that is connected with a black line across the anterior margin but not extending to the base of the scutellum; lateral mesothoracic lobes
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly. Scutellum without a central black line, the apex with a transverse black spot; middle mesothoracic lobe with two triangular black spots anteriorly. S. marshalli. 59. Middle mesothoracic lobe with a club-shaped central black spot that is connected with a black line across the anterior margin but not extending to the base of the scutellum; lateral mesothoracic lobes with a black line; scutellum with a club-shaped median black spot that is connected with a trans-
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly. Scutellum without a central black line, the apex with a transverse black spot; middle mesothoracic lobe with two triangular black spots anteriorly. S. marshalli. 59. Middle mesothoracic lobe with a club-shaped central black spot that is connected with a black line across the anterior margin but not extending to the base of the scutellum; lateral mesothoracic lobes with a black line; scutellum with a club-shaped median black spot that is connected with a transverse line at base; a minute spot in mesopleural furrow, the apex of hind coxæ, a spot at apex of hind femora and spots or bands on dorsum of abdomen, black; \(\varphi\). S. morleyi. 59*. Some old species fall in here.
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly. Scutellum without a central black line, the apex with a transverse black spot; middle mesothoracic lobe with two triangular black spots anteriorly. S. marshalli. 59. Middle mesothoracic lobe with a club-shaped central black spot that is connected with a black line across the anterior margin but not extending to the base of the scutellum; lateral mesothoracic lobes with a black line; scutellum with a club-shaped median black spot that is connected with a transverse line at base; a minute spot in mesopleural furrow, the apex of hind coxæ, a spot at apex of hind femora and spots or bands on dorsum of abdomen, black; \$\varphi\$. Some old species fall in here. 60. Middle mesothoracic lobe with a central black line; scutellum with a black line across the base and
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly. Scutellum without a central black line, the apex with a transverse black spot; middle mesothoracic lobe with two triangular black spots anteriorly. S. marshalli. 59. Middle mesothoracic lobe with a club-shaped central black spot that is connected with a black line across the anterior margin but not extending to the base of the scutellum; lateral mesothoracic lobes with a black line; scutellum with a club-shaped median black spot that is connected with a transverse line at base; a minute spot in mesopleural furrow, the apex of hind coxæ, a spot at apex of hind femora and spots or bands on dorsum of abdomen, black; \(\phi \). S. morleyi. 59*. Some old species fall in here. 60. Middle mesothoracic lobe with a central black line; scutellum with a black line across the base and with the apex black, or with a slight median black line. Metanotum without a central black line. 61
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly. Scutellum without a central black line, the apex with a transverse black spot; middle mesothoracic lobe with two triangular black spots anteriorly. S. marshalli. 59. Middle mesothoracic lobe with a club-shaped central black spot that is connected with a black line across the anterior margin but not extending to the base of the scutellum; lateral mesothoracic lobes with a black line; scutellum with a club-shaped median black spot that is connected with a transverse line at base; a minute spot in mesopleural furrow, the apex of hind coxæ, a spot at apex of hind femora and spots or bands on dorsum of abdomen, black; \(\varphi\). S. morleyi. 59*. Some old species fall in here. 60. Middle mesothoracic lobe with a central black line; scutellum with a black line across the base and with the apex black, or with a slight median black line. Metanotum without a central black line. 61 Metanotum with a central black line.
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly
Hind femora immaculate. Scutellum with a central black line, the apex yellow; middle mesothoracic lobe with a transverse black line anteriorly

	femora armed with a large tooth, followed by eighteen small black teeth; abdomen in \circ fusiformly pointed, the petiole at least thrice as long as thick, in \circ long ovate, the petiole at least four times as
	long as thick
62.	Hind coxæ immaculate
	Hind coxe with a black stripe beneath.
	Mesopleural furrow black; abdomen conic-ovate, more or less banded with fuscous, the petiole
	not thrice as long as thick; legs, except as noted, yellow, immaculateS. lineocoxalis.
63.	Some old species fall in here.
64.	The two black lines on the anterior part of the middle mesothoracic lobe unite and form a loop or a
	delta-shaped mark, which is sometimes connected with the base of the scutellum by a black line. 65
	The two black lines on the anterior part of the middle mesothoracic lobe do not unite to form a loop
	or delta-shaped mark
65.	Mesopleural spiracles surrounded by black
	Mesopleural spiracles <i>not</i> surrounded by black
66	The black loop on the middle mesothoracic lobe is connected with the base of the scutellum by a
	central black line
	The black loop on the middle mesothoracic lobe is not connected with the base of the scutellum by a
	central black line
67	Lateral mesothoracic lobes not margined with black along the inner margin, at the most with a black
01.	spot
	Lateral mesothoracic lobes margined with black along the inner margin.
	Hind femora with a black spot on disk outwardly
00	Hind coxæ immaculate, except at extreme apex; abdomen conic-ovate, fusiformly pointed or lanceo-
00.	
	late
	Hind coxe with a black spot above.
	Abdomen short, globose
69.	Hind femora immaculate, or at most with a small spot at apex, the disk never maculate
	Hind femora with a curved black spot across the disk and a small black spot at apex.
	Abdomen conic-ovate
	Abdomen fusiformly pointed or lanceolate, the petiole at least thrice as long as thick S. magrettii.
71.	Lateral mesothoracic lobes with an abbreviated black line on the inner margin.
	Hind femora immaculate or at most with a small black spot at apex
	Hind femora with an oblong black spot on disk near the upper margin.
	Hind coxe immaculate
72.	Hind coxæ with a small black spot above; loop on the middle mesothoracic lobe more or less incom-
	plete, the lines interrupted on each side of the line from the base of the scutellumS. incompleta
	Hind coxæ immaculate; loop on the middle mesothoracic lobe complete
73.	Scutellum with three triangular black spots at base and a triangular black spot at apex S. fulleri.
74.	Scutellum with three black spots at base, the apex with a black spot or with a central black line 75
	Scutellum with a transverse black line at base or with only two black spots
75.	Lateral mesothoracic lobe with a black spot; hind femora with a black spot at apex; abdomen fusi-
	formly pointed, the petiole from two and one half to three times as long as thick.
	Hind coxe with a black spot at base above; petiole of abdomen yellow; pronotum with four
	black spots
	. Hind coxe immaculate, or without a black spot at base above; petiole of abdomen black; pro-

	notum immaculate
76.	Scutellum with a transverse black line at base, usually in the basal suture
	Scutellum with two black spots at base, connected with a black line in the basal suture; a small black
	spot at apex.
	Lateral mesothoracic lobes with a black spot at apex; abdomen fusiformly pointed, the tip alone
	black, the petiole only a little longer than thick; 9
77.	$ Hind \ femora \ with \ a \ small \ black \ spot \ at \ apex \ ; \ scutellum \ with \ a \ small \ triangular \ black \ spot \ at \ apex \ ; $
	abdomen conic-ovate, the petiole about twice as long as thick; J
78.	Thorax yellow, a puncture on each side of pronotum, a spot on the lateral mesothoracic lobes, two
	short lines on the middle lobe anteriorly and a spot posteriorly near the scutellum, a spot on the
	axillæ and a spot at apex of scutellum, black; legs immaculate; apical half of abdomen black, the
	petiole nearly five times as long as thick; J

	scutellum with a delicate median black line; abdomen fusiform; segments two to six with fuscous
	bands; J
81.	Scutellum immaculate; abdomen subglobose; hind femora with two black spotsS. bipunctata.
82.	Abdomen in \$\Q\$ fusiformly pointed, the sheaths of the ovipositor black, the petiole not quite twice as
	long as thick (in of three or more times longer than thick)

SPILOCHALCIS TARSALIS, sp. nov.

Female.—Length 5.5 mm. Black, coarsely punctate; front orbits, face below the insertion of the antennæ, hind orbits, scape beneath, the hind margin of the pronotum, except medially, a line on each side of the scutellum, the base and apex of front tibiæ, all tarsi, and the petiole of the abdomen, yellow. Abdomen subglobose, polished black, except a reddish spot at base beneath.

Brazil: Chapada, in May. One specimen.

SPILOCHALCIS ATRATA, sp. nov.

Female.—Length about 7 mm. (Head lost.) Black, coarsely punctate; hind margin of protonum, a spot on the hind angles of the parapsides, a line across the base of the scutellum and the ridge at apex, and the front knees and tarsi, yellow, the tarsal joints more or less dusky medially.

Brazil: Santarem. One specimen in bad condition.

SPILOCHALCIS SANTAREMENSIS, sp. nov.

Female.—Length 5.5 to 6 mm. Black, coarsely punctate; front and hind orbits, scape, pronotum above, tegulæ, apical half of scutellum, except the ridge at apex,

the apical half or more of front and middle femora and their tibiæ and tarsi, a large spot on upper outer angle of hind femora and the hind tarsi, yellow. Abdomen ovate, the basal half yellowish, the apical half black; the petiole is short, hardly twice as long as thick.

Male.—Length 6 mm. Agrees well with the female, except the middle mesothoracic lobe is margined with yellow, the scutellum has two large yellow spots at the sides, the front and middle legs, except the coxe, are yellow, while the abdominal petiole above is yellow and five or six times as long as thick.

Brazil: Santarem; Chapada, in August. One male and three female specimens.

SPILOCHALCIS RUFODORSALIS, sp. nov.

Female.—Length S mm. Mostly red and almost smooth, the mesopleura, the reticulated metathorax and the hind coxe, except at base beneath and at apex, being black; flagellum brown-black; front and middle legs, tips of hind coxe, the hind tarsi, and the petiole of the abdomen yellow. The abdomen is ovate, the petiole hardly five times as long as thick.

Brazil: Santarem. One specimen.

SPILOCHALCIS LATICEPS, sp. nov.

Female.—Length 8.5 mm. Mostly red and feebly punctate, the sutures of thorax dusky, the pronotum yellowish; the scape, the front and middle legs, except the thickened part of the front and middle femora and the middle tibiæ basally, and the hind tarsi, are yellow; hind legs reddish, the hind coxæ with a dusky spot above toward base. The abdomen is ovate, the petiole yellow and about thrice as long as thick. The head is abnormal, seen from in front, about twice as wide as long, the face being concave; the eyes are large, rounded and occupy nearly the whole sides of the head, the temples being flat, undeveloped.

Brazil: Santarem. One specimen.

SPILOCHALCIS NIGROPETIOLATA, sp. nov.

Female.—Length 4 mm. Mostly red and faintly rugulosely punctate, the middle mesothoracic lobe posteriorly and the petiole of the abdomen being black; the flagellum, except the first three joints beneath, is brown-black; the front and middle legs are yellowish; the hind legs are pale ferruginous; while the body of the abdomen is pale ferruginous with a black spot on the disk above.

Brazil: Santarem. One specimen.

SPILOCHALCIS RUFOSCUTELLARIS, sp. nov.

Female.—Length 8 mm. Black, faintly punctate, the middle mesothoracic lobe posteriorly, the lateral lobes and the scutellum red; scape, tegulæ, the front and

middle legs and the long abdominal petiole, yellow; hind legs, except the femora, ferruginous, the femora black; body of abdomen black.

Brazil: Chapada, in November. One specimen.

SPILOCHALCIS FLAVOBASALIS, sp. nov.

Female.—Length 3 mm. Mostly red; the head, the pleura and the metanotum black; scape, front and middle legs, hind tarsi and basal half of abdomen, including the petiole, pale yellowish; hind legs, except tarsi, pale ferruginous, the femora darker than the coxæ.

Brazil: Chapada. One specimen.

SPILOCHALCIS JANEIROENSIS, sp. nov.

Female.—Length 3.5 mm. Black, punctate; a line on hind orbits, a dot at summit of eyes, a short line on the front orbits, two approximate spots on the middle of the pronotum posteriorly, the lateral margin of same and two dots before, two dots on the middle mesothoracic lobe, three dots of the lateral lobes, and the lateral margins of the scutellum, yellow or yellowish-red; knees, tips of tibiæ and beneath, and all tarsi, yellow; hind legs mostly black, the hind femora with a minute spot above and two irregular spots at apex, yellow; hind tibiæ yellow with a black ring near the middle. The abdomen polished black except two yellowish-white spots on dorsum of the third segment.

Brazil: Rio de Janeiro, in August. One specimen. This species is allied to S. nigrita Howard, described from St. Vincent.

SPILOCHALCIS FLAVOORBITALIS, sp. nov.

Female.—Length 7.5 mm. Black, coarsely punctate; irregular marks on vertex, the front and hind orbits, face below antennæ, dorsum of pronotum, except a black spot at sides, the margins of the middle mesothoracic lobe, a spot at the outer basal angle of the lateral lobes, the tegulæ, a spot in front and a spot beneath, two large, oblique, nearly confluent spots at base of scutellum and the ridge at apex, two spots on metathorax, the front and middle legs, except coxæ, more or less of their femora yellow; the hind legs are mostly black, the coxæ striped with yellow beneath and above, the femora margined with yellow at base and above, and with a curved yellow mark outwardly, starting a little beyond the middle and extending to the apex; the hind tibiæ are yellowish outwardly from basal third. The abdomen above is mostly black, banded with yellow, the petiole and the basal half of the second segment being yellow, the following dorsal segments more or less distinctly banded with yellow basally.

Brazil: Santarem. One specimen.

SPILOCHALCIS PERSIMILIS, sp. nov.

Male.—Length 6.5 mm. Black, coarsely punctate; orbits, cheeks, pronotum, except in front, spots on each side, the margins of the middle mesothoracic lobe, a line on the outer margin of the lateral lobes, two large nearly confluent spots towards apex of scutellum, metathorax, except at base above, tegulæ, a spot on mesopleura at insertion of the hind wings, front and middle legs, except coxæ, the petiole of abdomen and the basal half of the second abdominal segment, yellow. The hind legs are broken off and cannot be described. Wings hyaline, with a fuscous spot or cloud enclosing the apex of the stigmal vein; veins dark brown.

Brazil: Chapada. One specimen.

SPILOCHALCIS UNIMACULATA, sp. nov.

Female.—Length 4.5 mm. Black and yellow, punctate. Head yellow, the occiput, a large spot on the forehead and the scrobes black; thorax black, the pronotum above, the margins of the middle mesothoracic lobe, the outer margins of the lateral lobes, the scutellum except a central black spot, the axillæ except a spot at base, the tegulæ, a spot beneath, spots on pleura above, and a transverse spot on each side of the metathorax nearly confluent, yellow; legs yellow, the hind coxæ with a black spot at base beneath and a black or fuscous streak or spot above; the hind femora on outer face are mostly yellow but with a black spot above towards apex, a black streak beneath and a black spot beyond it at apex; the inner face is mostly black with a large yellow spot towards apex. Wings hyaline, with a fuscous spot at apex of the stigmal vein.

Brazil: Chapada, in April. Two specimens.

SPILOCHALCIS PERPLEXA, sp. nov.

Female.—Length 5 mm. Head yellow, the occiput, vertex and scrobes black; thorax black marked with yellow, the pronotum yellow, the front face and a small area on each side of dorsum black; middle mesothoracic lobe marginal with yellow, the lateral lobes margined with yellow outwardly at base and along the inner margin at base; scutellum yellow, with a black central spot, the axillæ with a small black spot at base; pleura mostly yellow with two black spots, the metathorax yellow except a black spot at base; legs yellow, the hind coxæ with a black spot above toward base, the femoral teeth small, black, the hind tibiæ with a black line beneath; abdomen conically pointed, a little longer than the head and thorax united, the petiole yellow, a little more than thrice as long as thick, the body of abdomen red-dish-yellow, the sheaths of the ovipositor black, the first segment with a yellowish spot at each side near base, the second and following segments marked with yellow

at the sides and along the venter. Wings hyaline, with a fuscous spot or cloud from the apex of the stigmal vein; veins brownish.

Brazil: Chapada, in April. One specimen.

SPILOCHALCIS IMITATOR, sp. nov.

Female.—Length 5 mm. Stature and form of S. perplexa, but differing in color of thorax, hind legs and abdomen. The parapsidal sutures are black, the middle mesothoracic lobe has a black line down the center, the lateral lobes are reddish, broadly margined with yellow, the scutellum is yellow, with a large central black spot, the hind coxe have only a faint trace of the black spot above, while the body of the abdomen except the sheaths of the ovipositor, is entirely pale ferruginous, without the yellow marks; otherwise it is scarcely distinguishable from S. perplexa.

Brazil: Chapada, in August. One specimen.

SPILOCHALCIS SIMILLIMA, sp. nov.

Female.—Length 5 mm. Stature and form as in the two previous species but differing in color. Yellow, the occiput, the parapsidal furrows, the pronotal suture, a short median line on the middle mesothoracic lobe posteriorly, and the sheaths of the ovipositor, black; the scutellum has a dark line down the center; the hind coxe, except at the extreme apex, are wholly yellow.

Brazil: Chapada, in April. One specimen.

SPILOCHALCIS CHAPADÆ, sp. nov.

Male.—Length 3.8 mm. Yellow; legs and flagellum brown; middle mesothoracic lobe anteriorly and the tip of the metathorax black or dusky, the hind coxe above reddish or ferruginous; abdomen ferruginous, the body oblong oval, with some fuscous or blackish stains or marks at sides toward apex, the petiole longer than the metathorax. Wings hyaline, with a fuscous cloud from the apex of the stigmal vein.

Brazil: Chapada, in April. One specimen.

This may be the male of S. imitator.

SPILOCHALCIS ALBOMACULATA, sp. nov.

Female.—Length 7 mm. Head black, with the hind and front orbits, the clypeus, the face, the mandibles, except teeth, and the scape, yellowish-white; thorax black, with the dorsum of pronotum, margins of the middle mesothoracic lobe, the outer margins of the lateral lobes, two large spots on scutellum, nearly confluent at apex, and the depression on each side of the metathorax, yellowish-white; petiole of abdomen and front and middle legs, yellowish-white; body of

abdomen conic-ovate, the basal half pale ferruginous, the apical half black; hind legs mostly black, the hind coxæ reddish at base above, the hind femora with three large whitish spots, the tibiæ black or brown-black, the tarsi white.

Brazil: Corumba, in May. One specimen.

SPILOCHALCIS SANTAREMA, sp. nov.

Female.—Length 4 mm. Head mostly yellow, the occiput black, the vertex brownish at the middle; flagellum black; thorax black beneath and at apex, the pronotum yellow, the mesonotum reddish or reddish-brown, the lobes margined with yellow, the middle lobe blackish down the center, the scutellum black margined with yellow; body of abdomen ovate, ferruginous, the petiole yellow and about thrice as long as thick, the sheaths of the ovipositor black; the front and middle legs are entirely yellow, the hind legs are mostly black, their femora with a large yellow spot at the upper outer angle and a small spot beneath it, their tibiæ narrowly black or dark fuscous at base and at apical third, while the tarsi are yellow. Wings hyaline, the veins brown-black.

Brazil: Santarem. One specimen.

SPILOCHALCIS ERYTHROGASTER, sp. nov.

Female.—Length 5.5 mm. Black, coarsely punctate; orbits, face below insertion of antenne, the dorsum of pronotum, the margins of the middle mesothoracic lobe, the lateral lobes outwardly, the tegulæ, two large spots on the scutellum, a spot enclosing the metathoracic spiracles, the short abdominal petiole, and the front and middle legs, yellow; the hind legs are mostly black, the tarsi, a spot at base of coxæ above and three spots on hind femora, yellow; body of abdomen ovate, rufous, the sheaths of the ovipositor black. Wings hyaline, the veins brown-black.

Brazil: Chapada and Santarem. Two specimens.

Spilochalcis flavoaxillaris, sp. nov.

Female.—Length 7.5 mm. Black, coarsely punctate; orbits a Λ-shaped mark on the face below the insertion of the antennæ, the clypeus, the dorsum of the pronotum, except a line at the sides, the margins of the middle mesothoracic lobe, the outer margins of the lateral lobes, a line across the base of the scutellum and the axillæ, yellow; the abdomen, except the petiole, the base of the second segment, a band at the base of the third and fourth segments which are black, is mostly yellow; the front and middle legs are yellowish and ferruginous marked with black, the hind legs black and yellow; the hind coxæ are black with a small yellow spot at apex and a yellow stripe above, the hind femora are yellow with a black line at

base, the outer face with a triangular black spot on basal half and a curved black line at apex; the inner face has two large black bands or stripes. Wings hyaline, with a yellowish tinge, the veins pale ferruginous.

Brazil: Santarem. One specimen.

SPILOCHALCIS MARGINATA, sp. nov.

Female.—Length 5 mm. Head, except the occiput and the scrobes which are black, yellow; flagellum black; dorsum of pronotum, except a small black spot on each side, the margins of the middle mesothoracic lobe and a small spot anteriorly, the outer margins of the lateral lobes, the scutellum except a large central black spot, the metathorax except a central black stripe, the tegulæ, a spot beneath, and the margins of the metapleura, yellow; legs mostly yellowish-white, the hind coxæ with a large black spot above, the hind femora with three black spots on outer face, a small spot above towards apex and a single spot on the inner face, black. Abdomen yellow, the dorsal segments banded with black.

Brazil: Santarem. One specimen.

SPILOCHALCIS TUBERCULATA, sp. nov.

Female.—Length 4 mm. Yellow; eyes and flagellum brown; lobes of mesothorax black margined with yellow; a spot on scutellum at base, a spot on metanotum and the pleura black. The abdomen is conic-ovate, ferruginous, the petiole yellow and about thrice as long as thick. The hind femora are armed with nineteen or twenty minute teeth beneath and have a black or brownish spot at apex. The face is armed with a very long tubercle, which originates from the ridge between the insertion of the antennæ.

Brazil: Chapada, in January. One specimen.

SPILOCHALCIS BIDENTATA, sp. nov.

Female.—Length 6.5 mm. Black, coarsely punctate; orbits, the face below the insertion of the antennæ, the scape beneath, the apex of flagellum, the prothorax, except a spot on each side of the front face of the pronotum, the margins of the middle mesothoracic lobe at sides and base and the outer and basal margins of the lateral lobes, a band all around the scutellum, the metathorax, and the upper part of the mesopleura, yellow; legs mostly yellow, the hind legs marked with black, the hind tibiæ with a black annulus at base and another one near the middle. The abdomen is yellowish or pale ferruginous, the dorsal segments, three and beyond, more or less blackish or fuscous.

Brazil: Santarem. One specimen.

SPILOCHALCIS MACULATA, sp. nov.

Female.—Length 6.5 mm. Black, coarsely punctate; orbits, a line connecting the ocelli, face below antennæ, cheeks, the scape, the dorsum of pronotum, except a triangular black spot at basal lateral angles, the margins of the middle mesothoracic lobe, the outer margins of the lateral lobes, the scutellum except a central black line, the metathorax except a transverse line at base, the tegulæ, a spot beneath, the anterior margin of the mesopleura, a large spot on the side of the metapleura and the legs, except the hind femora, yellow; the hind femora have a large black spot toward base, a black spot at apex beneath, and a black spot above toward apex. The abdomen is short ovate, banded with black, the petiole about four times as long as thick.

Brazil: Chapada, in December. One specimen.

SPILOCHALCIS HEMPELI Sp. nov.

Female.—Length 8.5 mm. Head, except the occiput and the scrobes, which are black, yellow; scape and apex of the flagellum yellow, the first five joints of the funicle black; prothorax, except the front face, the margins of the middle mesothoracic lobe, the lateral margins of the lateral lobes, the scutellum except a large oblong, central black spot, the metathorax, except a narrow, central black line, the sides of the thorax and the legs, except the minute black teeth on the hind femora and a black stripe on the hind tibiæ beneath, yellow. The abdomen is conically produced, longer than the head and thorax united, the eighth segment being styliform, the petiole very short transverse; it is yellowish with dorsal segments three to six more or less dusky or fuscous basally and appearing banded, when viewed from above.

Male.—Length 5.4 mm. Differs from the female in the shape of the abdomen which is long oval, the petiole being about four times as long as thick, the dorsal segments not banded, while the hind femora have a large black spot on inner face near the upper margin.

Brazil: Santarem.

Named in honor of Mr. Adolph Hempel.

SPILOCHALCIS DEVIA, sp. nov.

Female.—Length 6 mm. Yellow; a spot on vertex extending on to the occiput, and a line in the antennal depression, black; flagellum brown at base but becoming fulvous from the third joint; thorax mostly yellow but marked with black as follows: The prothorax is yellow with a small black spot on each side above and a large transverse black band on the front face or the declivity; the middle meso-

thoracic lobe is black broadly margined with yellow, the lateral lobes black marked with yellow along the outer sides; the scutellum is yellow with a large, triangular, central black spot, and a transverse black line at base, dilated on the axillæ; the metathorax has a transverse black line at base. The abdomen is fusiform, pale ferruginous, except the petiole, the dorsum with four or five brownish bands, the sheaths of the ovipositor black; the petiole is yellow and about five times as long as thick. The hind femora are armed with thirteen or fourteen black teeth, while the hind tibiæ have a black spot on the outer face near the middle.

Brazil: Santarem. One specimen.

SPILOCHALCIS NIGROPLEURALIS, sp. nov.

Female.—Length 4.3 mm. Lemon-yellow, marked with black as follows: The occiput and a small spot in front of the lateral occili black; flagellum black; pronotum with a small spot on each side and a large median spot on the declivity or front face, black; mesothorax black, the lobes margined with yellow, the middle lobe also with a small yellow spot anteriorly; scutellum yellow, with a transverse line across the base, dilated on the axillæ, and a wedge-shaped central spot, black; basal suture of metathorax, the pleuræ, except spots beneath the insertion of the wings, black; the body of the abdomen is short, subovate, the dorsal segments two to seven medially more or less black; all the legs are yellow but marked with black as follows: The hind coxæ at apex, the trochanters, two large spots on the outer and inner face of hind femora and the base of the hind tibiæ, are black.

Male.—Length 4 mm. Colored and marked nearly as in the female, except the yellow spot on the middle mesothoracic lobe is greatly enlarged and divides the black into two parts, while the pleuræ, except the femoral furrow, are yellow.

West Indies: Trinidad; Brazil: Chapada.

SPILOCHALCIS CORUMBICOLA, sp. nov.

Male.—Length 6 mm. Lemon-yellow; occiput, scrobes and the scape above, black; flagellum brown-black, fulvous beneath; pronotum with a median spot on the front face and a small spot on the dorsum opposite the parapsidal furrows, black; mesothoracic lobes black margined with yellow, the middle lobe also with a yellow median spot; scutellum with a transverse black line at base and a narrow black line down the center; hind femora with a small rounded spot on outer and inner face and the minute teeth, about fourteen, black. The body of the abdomen is oval, mostly ferruginous, the dorsal segments tinged with fuscous basally, while the petiole is yellow and about twice as long as thick.

Brazil: Corumba, in April. One specimen.

SPILOCHALCIS MÜLLERI, Sp. nov.

Female.—Length 0 mm. Yellow, the occiput black, the black extending forward on the vertex and enclosing the ocelli; flagellum brown-black basally, the four or five apical joints fulvous; mesothoracic lobes black broadly margined with yellow, the black on the middle lobe with usually a central yellow spot; scutellum with a central black line and a black line across the base. The abdomen is elongate lanceolate or fusiformly pointed, longer than the head and thorax united, the eighth segment long, styliform, the petiole very short, transverse.

Brazil: Santarem. Three specimens.

Dedicated to the memory of Dr. Fritz Müller.

SPILOCHALCIS HOWARDI, sp. nov.

Female.—Length 7 mm. Yellow; the occiput, scrobes, a broad median line extending from the insertion of the antennæ forwards to the mandibles, the 3-dentate mandibles, the antennæ, a median band on the middle mesothoracic lobe widened anteriorly, a large spot on the lateral lobes, a central line on the scutellum, the femoral furrow on the mesopleura and anteriorly, the lower part of metapleura, the depression on each side of the metanotum, spots on front and middle coxæ, a large spot on the hind coxæ at base beneath, their apices, the abdominal petiole and bands on the dorsal abdominal segments, black. The body of the abdomen is fusiformly pointed, blackish at apex, the about three times as long as thick. The hind femora are armed with about twenty small teeth.

Brazil: Chapada, in November. One specimen.

Named in honor of Dr. L. O. Howard.

SPILOCHALCIS INSULARIS, sp. nov.

Male.—Length 5 mm. Yellow; a spot on occiput, a median spot on the front face of the pronotum, the sutures of the mesothoracic lobes, a line down the center of the middle lobe, a spot on the lateral lobes, a central line on the scutellum, a median line on the metanotum, the front margin of the mesopleura, a stripe on hind coxæ beneath and above, and three or four bands on the dorsal abdominal segments, black. The hind femora are armed with about twenty minute, black teeth.

West Indies: Trinidad.

SPILOCHALCIS TRINIDADENSIS, sp. nov.

Female.—Length 9 mm. Yellow; a spot on the occiput, the scrobes, the antennæ, except the scape beneath, a median line on front face of the pronotum, the sutures of the mesothoracic lobes, a central line on the middle lobe, a large spot on

the lateral lobes, a central line on the scutellum, a median line on the metathorax, a spot on the mesosternum anteriorly, the femoral furrow on the mesopleura, a stripe on the hind coxe *above*, and six bands on dorsum of abdomen, black. The abdomen is fusiformly pointed, a little longer than the head and thorax united, the petiole short, not longer than thick. The hind femora are armed with from twenty to twenty-two minute teeth.

West Indies: Trinidad. One specimen.

SPILOCHALCIS INCONGRUA, sp. nov.

Male.—Length 6 mm. Yellow, with black markings very nearly as in S. trinidadensis but with the following differences: The metathorax is without the median black line, the antennæ are wholly yellow, except the flagellum above, the hind coxæ have a small black spot above, while their extreme apices, including the first joint of the trochanters, are black; the hind femora have two black spots on outer face, one near the middle, the other at the apex and are armed with sixteen to seventeen small, black teeth; the hind tibiæ are entirely yellow.

Brazil: Chapada, in April. One specimen.

SPILOCHALCIS MAYRI, sp. nov.

Female.—Length 5.5 mm. Yellow; occiput with a transverse black spot; flagel-lum brown-black; a small median spot on front face of pronotum, the parapsidal furrows, a transverse line on the anterior margin of the middle mesothoracic lobe and a longitudinal line down the center, a small spot on each lateral lobe, a median line on the scutellum, a line in the mesopleural furrow and a spot on the hind coxe above black.

The abdomen is long, lanceolate, about twice as long as the head and thorax united, the petiole very short transverse, the dorsal segments more or less banded with fuscous, the terminal segment styliform. The hind femora are armed with one large tooth, followed by fourteen or fifteen minute teeth.

Brazil: Chapada, in May. One specimen.

SPILOCHALCIS TIMIDA, sp. nov.

Female.—Length 4 mm. Yellow, with the black markings much as in S. incongrua but with the following differences: The flagellum is wholly black, the hind coxe have the apices alone black, the hind femora have two black spots and are armed with about seventeen small black teeth, while the hind tibiæ are black at base.

Brazil: Corumba, in April.

SPILOCHALCIS BIANNULATA, sp. nov.

Female.—Length 5.5 mm. Yellow, with the black markings much as in S. timida, but differing as follows: The black lines on the middle mesothoracic lobe form an anchor-shaped mark **L**, the scutellum has an acute wedge-shaped black spot at apex, the hind femora have a large, irregular, black spot at basal third and a small black spot at apex below, while the hind tibiæ have two black rings, one at base, the other near the middle. The abdominal petiole is rather slender and four or more times longer than thick, the body of abdomen being ovate, black at apex and with some fuscous stains on the dorsal segments.

Brazil: Santarem. One specimen.

SPILOCHALCIS MEDIUS, sp. nov.

Female.—Length 4 mm. Yellow, with black markings much as S. timida, but differing as follows: The black central line on the middle mesothoracic lobe is only slightly dilated, the spots on the lateral lobes are smaller, nearly round and do not touch the parapsidal furrow as in S. timida, the hind femora have only a small black spot at apex and are armed with seventeen or eighteen minute black teeth, while the body of the abdomen is conic-ovate, black at tip, the petiole not slender, about thrice as long as thick.

Brazil: Corumba, in March. One specimen.

SPILOCHALCIS CAMERONI, sp. nov.

Female.—Length 4.5 mm. Yellow, with the black markings much as in S. medius, only the middle mesothoracic lobe has besides the median black line two other lines anteriorly, between the parapsidal furrows and the median line, that extend to the middle of the lobe; the hind femora have a black spot at base and a black spot at apex and are armed with about sixteen small black teeth; while the abdomen is conically pointed, blackish at apex, the dorsal segments stained with fuscous near the sutures, the petiole being about twice as long as thick.

Brazil: Rio de Janeiro. One specimen.

SPILOCHALCIS ENOCKI, sp. nov.

Female.—Length 5.75 mm. Yellow, with black markings as follows: The sutures of the mesonotum, a central line on the middle mesothoracic lobe, an oblong spot on the lateral lobes, a central line on the scutellum, a stripe on front margin of the mesosternum and a spot or line in the mesopleural furrow, are black; legs immaculate, the hind femora armed with about seventeen minute teeth, the teeth tipped with black; abdomen fusiformly pointed, the sheaths of the ovipositor black,

the dorsal segments more or less stained with fuscous, the petiole being about twice as long as thick.

West Indies: Trinidad.

Named in honor of Mr. Frederick Enock.

SPILOCHALCIS FUSIFORMIS, sp. nov.

Female.—Length 6.5 mm. Yellow, with black markings as follows: The parapsidal furrows, the suture at base of the scutellum, a median line on the scutellum, a central line on the middle mesothoracic lobe and two additional short lines anteriorly, one on each side of the central line, that extend to nearly half the length of the lobe, and a spot at base of the metanotum, black; flagellum brown-black above. The abdomen is elongate, fusiform, or lanceolate, as seen from the side, and longer than the head and the thorax united; the sheaths of the ovipositor alone being black; the petiole is very short, wider than long. The legs are immaculate, the hind femora being armed with about seventeen small black or black-tipped teeth.

Brazil: Porto Branca. One specimen.

SPILOCHALCIS URICHI, sp. nov.

Male.—Length 4 mm. Yellow marked with black as follows: The occiput, a central line on the middle mesothoracic lobe that is connected with a transverse line along the front margin, a large oblong spot on the lateral lobes, a line across the base of the scutellum and a wedge-shaped spot at apex, a spot in the mesopleural furrow, apex of hind coxe, the base of hind femora, an oblong spot on disk of outer face and a spot at apex, and the hind tibie, except a broad yellow annulus, black.

The hind femora are armed with about twenty-five minute black teeth.

West Indies: Trinidad.

Named in honor of Mr. F. W. Urich.

SPILOCHALCIS AXILLARIS, sp. nov.

Female.—Length 4 mm. Yellow marked with black as follows: The occiput, a spot on front face of pronotum, a broad central black line on the middle mesothoracic lobe, not quite extending to the anterior margin, a small spot on each side of this line anteriorly, a large oblong spot on the lateral lobes, a large spot at apex of the scutellum, the sutures at base and the axillæ, a spot at base of metathorax, a line in the mesopleural furrow, the apex of the hind coxæ, a spot at apex of hind femora, the apical third of hind tibiæ and some spots on the dorsum of abdomen, black.

The flagellum is black or brown-black, the scape and pedicel being yellow. The abdomen is conic-ovate, the petiole being about five times as long as thick. The hind femora are armed with seventeen small teeth.

Brazil: Santarem. One specimen.

SPILOCHALCIS TRILINEATA, sp. nov.

Female.—Length 5.5 mm. Yellow; a short line on the middle of the occiput, a large spot on the front face of the pronotum, a central line on the middle mesothoracic lobe connected with a transverse line anteriorly, an abbreviated line on the inner margins of the lateral lobes, a median line on the scutellum, and a line across the base, black. The hind femora are armed with seventeen or eighteen minute teeth. The abdomen is conic-ovate, the petiole being more than five times as long as thick.

Brazil: Santarem.

SPILOCHALCIS MARSHALLI, sp. nov.

Female.—Length 6.5–7 mm. Yellow; a line on scape above, the flagellum, a transverse spot at apex of the scutellum and a transverse line across the base, an abbreviated line along the inner margin of the lateral lobes of the mesonotum, a median line the entire length of the middle lobe, and two triangular spots on the anterior margin (one on each side of the median line), black. The abdomen is fusiform, the middle dorsal segments more or less blackish, or stained with fuscous, the base and apex, except the sheaths of the ovipositor, always yellow, the petiole being about twice as long as thick. The legs are immaculate, the hind femora armed with one large tooth, followed by about fifteen minute black teeth.

Male.—Length, 4–4.5 mm. Agrees in color with the female, but the body of the abdomen is long ovate, the petiole being a little more than three times as long as thick, while the basal tooth of the hind femora is followed by eighteen or nineteen minute black teeth.

West Indies: Trinidad. One female and three male specimens.

Named in honor of Rev. T. A. Marshall.

SPILOCHALCIS MORLEYI, sp. nov.

Female.—Length 5.5 mm. Yellow; a line on scape above towards the apex, the flagellum, a clavate, central spot on the scutellum connected with a transverse line at base, a line along the inner margins of the lateral mesothoracic lobes, a clavate median line on the middle lobe that is connected with a transverse line anteriorly, a small spot in the mesopleural furrow, the apex of hind coxæ, a spot at apex of hind femora, and two or three bands on the dorsum of the abdomen, black. The abdomen is short ovate, or subglobose, the petiole being a little more than three

times as long as thick. The hind femora are armed with seventeen or eighteen minute teeth.

Brazil: Bahia. Taken by Mr. Albert Koebele, March 19, 1883. Named in honor of Mr. Claude Morley.

SPILOCHALCIS APICALIS, sp. nov.

Female.—Length 4 mm. Yellow; the apical half of the flagellum, a spot on the occiput, a spot on front face of the pronotum, a transverse spot at apex and a transverse line at base of scutellum, a median line the entire length of the middle mesothoracic lobe, a central black spot on the metathorax, the extreme tips of hind coxæ; and a spot at apex of hind femora, black. The abdomen is conic-ovate, the sheaths of ovipositor black, the petiole being at least three times as long as thick. The hind femora are armed with one large acute tooth, followed by twelve minute black teeth.

Brazil: Rio de Janeiro. One specimen.

SPILOCHALCIS UNILINEATA, sp. nov.

Female.—Length 6.5 to 7 mm. Yellow; the flagellum, a small spot on the occiput, a dot on front face of pronotum, a central line on the middle mesothoracic lobe, a transverse line at base of scutellum and a transverse spot at apex, and a spot at apex of hind femora, black. The abdomen is fusiformly pointed, longer than the head and thorax united, the apex and the sheaths of the ovipositor black, the petiole being more than three times as long as thick. The hind femora are armed with one large tooth, followed by about eighteen minute black teeth.

West Indies: Trinidad.

SPILOCHALCIS LINEOCOXALIS, sp. nov.

Female.—Length 4 mm. Yellow; the occiput in part, a line along the malar suture, teeth of mandibles, the flagellum above, a short line on the front face of the pronotum, a small spot at the apex of the scutellum, a longitudinal median line anteriorly and a transverse line at base, a median longitudinal line on the middle mesothoracic lobe and a line across the anterior margin, a line between the pro- and mesosternum, the mesopleural furrow, the metasternum, a stripe on hind coxe beneath and bands on the dorsum of the abdomen, black. The abdomen is fusiform, the petiole about, or nearly, three times as long as thick. The hind femora are armed with a moderately large tooth followed by about twelve minute black teeth.

Brazil: Corumba, in May. One specimen.

SPILOCHALCIS FULLERI, sp. nov.

Female.—Length 7 mm. Yellow; a transverse spot on occiput, the flagellum, a triangular spot at apex of scutellum and three triangular spots at base, an oblong

spot on the lateral lobes of the mesothorax, two lines on the middle lobe anteriorly for about two thirds its length, a spot at apex of hind coxæ abore, a spot at apex of hind femora and the sheaths of the ovipositor, black. The abdomen is fusiform, longer than the head and thorax united, the petiole being only twice as long as thick. The hind femora are armed with one large tooth, followed by about sixteen minute black teeth.

West Indies: Trinidad. One specimen. Named in honor of Mr. Claude Fuller.

SPILOCHALCIS CORUMBENSIS, sp. nov.

Female.—Length 9 mm. Yellow; the occiput, the flagellum, a minute dot towards apex of the scutellum, the suture across its base, a spot on the lateral lobes of the mesothorax, a loop on the middle lobe anteriorly, a small spot in the mesopleural furrow, and the extreme apex of hind coxæ, black.

The abdomen is fusiformly pointed, longer than the head and thorax united, the petiole very short, transverse. The hind femora are armed with fourteen or fifteen minute teeth.

Brazil: Corumba, in April. One specimen.

SPILOCHALCIS CHAPADÆ, sp. nov.

Female.—Length 4.3 mm. Yellow; the occiput, scrobes, flagellum, a median longitudinal line on scutellum and the suture at base, a broad line along the inner margins of the lateral mesothoracic lobes, a loop connected with a short median line from the base of the scutellum, on the middle lobe, the mesopleural furrow, the apex of the hind coxæ, a small oblong spot on disk of the outer face of the hind femora and a spot at apex, and most of the body of the abdomen, black.

The abdomen is conic-ovate, the petiole at least thrice as long as thick. The hind femora are armed with fourteen or fifteen minute black teeth.

Brazil: Chapada, in April. One specimen.

SPILOCHALCIS BRANCENSIS, sp. nov.

Female.—Length 6 mm. Colored and marked very nearly as in S. chapadæ, except that the black spots on the lateral lobes of the mesothorax are shorter, the scutellum has a wedge-shaped black spot at the middle, the hind coxæ have a rounded spot above, while the hind femora have two black spots.

Structurally, however, there is no resemblance: The head in front is deeply semicircularly emarginate for the reception of the antennæ; the antennæ are separated at base by a sharp carina or spine; the hind coxæ are not nearly so long; the

hind femora are armed with sixteen or seventeen small black teeth; while the abdomen is subglobose, the dorsal segments stained with black or piceous, the petiole about three times as long as thick.

Brazil: Porto Branca. One specimen.

SPILOCHALCIS VAGABUNDA, sp. nov.

Female.—Length 7.5 mm. Yellow, the head and thorax marked with black as in S. brancensis but structurally it is quite different: The head is broader, not deeply semicircularly emarginate in front; the abdomen is conically pointed, longer than the head and thorax united, the sheaths of the ovipositor black, the petiole short, not longer than thick; some of the dorsal segments are more or less banded with brown or black; the hind coxæ have a black spot at apex, their femora have a black line at base and along the lower or serrate edge, the same being connected with an arcuate black mark on the outer face and a spot at apex. The hind femora are armed with about eighteen minute black teeth.

Brazil: Santarem.

SPILOCHALCIS LANCEOLATA, sp. nov.

Female.—Length 5.5 mm. Colored and marked with black much as in S. vagabunda, except that the pleura are immaculate, the hind femora have a black spot only at apex and are armed with only fourteen minute black teeth. It also differs decidedly in the shape of the abdomen, which is long, lanceolate, the petiole being much longer, at least three times as long as thick.

Brazil: Santarem.

SPILOCHALCIS VAU, sp. nov.

Female.—Length 5 mm. Yellow; a spot on the occiput, a V-shaped mark on the middle mesothoracic lobe anteriorly, not connected with a black line posteriorly, a spot on each lateral lobe, a line across the base of the scutellum and an abbreviated longitudinal line on the disk, a line in the mesopleural furrow, an oblong mark on the outer face of the hind femora, the abdominal petiole, and bands on dorsal segments of the abdomen, black; scape and pedicel wholly yellow (flagellum broken off). The abdomen is ovate, the petiole being long, about six times as long as thick. The hind femora are armed with about fifteen minute black teeth.

Brazil: Chapada, in April. One specimen.

SPILOCHALCIS INCOMPLETA, sp. nov.

Female.—Length 6.0 mm. Yellow: marked with black as in S. vau, only the loop on the middle mesothoracic lobe is open posteriorly and there is a black line extending from it to the base of the scutellum, the scape has a black line above, the

flagellum being wholly black, the hind coxæ have a small black spot near the middle *above*, the hind femora have a minute spot on the middle of the disk and a black spot at base and apex.

The abdomen is conically pointed, longer than the head and thorax united, the sheaths of the ovipositor and a slender band at base of dorsal segments 3 to 7, black; the petiole is hardly longer than thick. The hind femora are armed with one moderate sized tooth, followed by about eighteen minute black teeth.

Brazil: Corumba, in May. One specimen.

SPILOCHALCIS PERSIMILIS, sp. nov.

Female.—Length 4 mm. Yellow; the thorax marked with black as in previous species, except that the loop is complete, not interrupted before uniting with the median black line posteriorly; the hind coxe and femora are immaculate.

The abdomen is conic-ovate, not so long nor so pointed as in previous species, the dorsal segments four to seven brownish or blackish, the petiole being three times as long as thick. The hind femora are armed with about fifteen minute black teeth.

Brazil: Corumba, in April. One specimen.

SPILOCHALCIS HOLLANDI, sp. nov.

Female.—Length 0.5 mm. Yellow; the occiput, a line on the scrobes enclosing the front ocellus, a line on the scape above, the flagellum, two median lines on the front face of the pronotum and a line on each side of the dorsum, two broad lines on the middle mesothoracic lobe anteriorly, a spot on the lateral lobes, three triangular spots at base of scutellum, the middle one being connected with a central line that extends to and terminates in a spot at the apex of the scutellum, a large rounded spot at base of hind coxæ above, the apex of hind coxæ, a spot at apex of hind femora, the extreme base of hind tibiæ and an annulus at the middle, all black.

The abdomen is conically produced, longer than the head and thorax united, the petiole only about twice as long as thick. The hind femora are armed with one large tooth, followed by about eighteen minute teeth.

Brazil: Santarem. One specimen.

Named in honor of Dr. W. J. Holland.

SPILOCHALCIS CORUMBÆ, sp. nov.

Female.—Length 7.5 to 8 mm. Yellow, marked with black as in S. hollandi except that the spots at base and apex of scutellum are not connected by a central black line, the hind coxæ being without the spot at base above, while the apical seg-

ment of the abdomen is wholly black, the petiole being hardly longer than thick-The hind femora are armed with one large tooth followed by fifteen or sixteen minute black teeth.

Brazil: Corumba; Porto Branca; West Indies: Trinidad.

SPILOCHALCIS PARAGUAYENSIS, sp. nov.

Male.—Length 6 mm. Yellow, marked with black as in S. corumbæ, except that the scutellum has a slender black line across the base and a triangular spot at apex; the hind coxæ have the apex black; the hind femora have black spot at apex as in S. corumbæ, but a large tooth is followed by seventeen or eighteen minute black teeth. The abdomen is fusiform, the petiole being three times as long as thick.

Paraguay: Villeta. One specimen.

SPILOCHALCIS DIMIDIATA, sp. nov.

Male.—Length 4.5 mm. Yellow; a spot on occiput, the ocelli, a small spot on each side of the dorsum of the pronotum, a quadrate spot at the base of the middle mesothoracic lobe, just in front of the scutellum, and two short longitudinal lines anteriorly, a spot on the lateral lobes, a triangular spot at apex of the scutellum, and the apical half of the abdomen, black. The body of the abdomen is ovate, the petiole being long, a little more than four times longer than thick. The hind femora are armed with sixteen or seventeen minute, black teeth.

Brazil: Chapada, in October. One specimen.

SPILOCHALCIS MERIDIONALIS, sp. nov.

Female.—Length 4 mm. Yellow; the occiput, the flagellum, two triangular spots on the anterior margin of the middle mesothoracic lobe, a faint dot on the lateral lobes, the axillæ and a spot at base of scutellum, a median line on the metanotum and its apex, the extreme apex of hind coxæ, a spot at apex of hind femora, and the sheaths of the ovipositor, black.

The abdomen is conic-ovate, the petiole being a little more than three times as long as thick; the dorsal segments are more or less stained with brown or fuscous.

The hind femora are armed with one large acute tooth, followed by thirteen or fourteen smaller teeth, those near the apex being very minute.

West Indies: Trinidad. One specimen.

SPILOCHALCIS TRIPUNCTATA, sp. nov.

Male.—Length 3.5 mm. Yellow; a spot on the occiput, the flagellum above, the sutures surrounding the middle mesothoracic lobe, a minute spot on the disk of the lateral lobes, an elongate spot on the middle of the middle lobe, a delicate longi-

tudinal line down the center of the scutellum, a line in the mesopleural furrow, and a spot on the outer face of hind coxæ, near the middle, black.

The abdomen is conic-ovate, the dorsal segments narrowly banded with brown at base, the petiole hardly more than twice longer than thick. The hind femora are armed with about fourteen minute black teeth.

Type.—Cat. No. 7317 U. S. N. M.

Brazil: Bonito Prov. Pernambuco (Mr. Albert Koebele).

SPILOCHALCIS BIPUNCTATA, sp. nov.

Female.—Length 5.5 mm. Yellow; immaculate, except two black spots on the mesothorax (a spot on each lateral lobe) and two spots on the hind femora; flagel-lum brown. The abdomen is subglobose, the petiole short, hardly as long as wide. The hind femora are armed with ten or eleven small teeth.

Type.—Cat. No. 7318 U. S. N. M.

Brazil: Bonito Prov. Pernambuco (Mr. Albert Koebele).

XANTHOMELANUS Ashmead, gen. nov.

In this genus the metathorax is quadridentate posteriorly, two teeth on each side of the petiole; the plate at apex of the scutellum is emarginate or bidentate, while the hind femora are armed with several large teeth.

XANTHOMELANUS DIMIDIATUS (Fabricius).

Brazil: Venezuela; West Indies: Trinidad.

MELANOSMICRA Ashmead, gen. nov.

This genus in having the metathorax quadridentate agrees with *Xanthomelanus* but otherwise it is quite distinct. The scutellum is normal, unarmed; the antennæ are long, the scape reaching beyond the ocelli; while in its abdominal characters it shows some affinity with *Ceratosmicra*, only the petiole is not so long as in typical species. The black color of the head and thorax is characteristic.

MELANOSMICRA CLAVATA (Fabricius).

Chalcis clavata Fabricius, Syst. Piez., 1804, p. 162.—Dalla Torre, Cat. Hym., V., 1898, p. 387.

Brazil.

MELANOSMICRA IMMACULATA, sp. nov.

Male.—Length 5 mm. Head and thorax entirely black; scape of antennæ, the front and middle legs, the hind tarsi, and the long abdominal petiole, yellow; body of abdomen red; flagellum filiform, brown-black; while the hind legs, except the tarsi, are pale ferruginous.

Brazil: Chapada, in December.

THAUMAPUS ACUMINATUS, sp. nov.

Female.—Length 9 mm. Reddish-yellow; a line on the scape above, the flagellum, a triangular spot at apex of the scutellum and a transverse line at base, a spot on the lateral mesothoracic lobes, a curved line anteriorly on the middle lobe, interrupted medially, the extreme apex of the hind coxæ, the large femoral teeth, and some spots on the dorsum of the abdomen, black. The abdomen is long, lanceolate and ends in a long stylus. The hind femora are armed with six large teeth, the last tooth very large and tricuspidated.

Brazil: Santarem. One specimen.

Genus EPINÆUS Kirby.

ENNEASMICRA Ashmead, gen. nov.

In this genus the hind femora are armed with nine moderately large teeth and the scutellum is usually bidentate or emarginate at apex, rarely normal.

ENNEASMICRA EXINANIENS (Walker).

Smiera exinaniens Walker, Trans. Ent. Soc. London (3), II., 1864, p. 198, ♀. Smicra exinaniens Dalla Torre, Cat. Hym., V., 1898, p. 377.

Brazil.

ENNEASMICRA CORUMBENSIS, sp. nov.

Female.—Length 6.5 mm. Yellow; a spot on the occiput, a small dot on the middle of the front face of the pronotum, an oblong spot on the inner margin of the lateral mesothoracic lobes anteriorly, two long triangular spots on the middle lobe anteriorly and a median line posteriorly, a spot at apex of the scutellum which is connected with a central line, the mesopleural furrow, a small spot on the hind coxæ near the base, and three spots on the hind femora, black. The abdomen is conicovate, the body brownish or fuscous above, the petiole hardly twice as long as thick and yellow. The hind femora are armed with nine large, black teeth, the last two more or less united at base.

Brazil: Corumba in April. One specimen.

ENNEASMICRA INCERTA, sp. nov.

Male.—Length 7 mm. Reddish golden brown; the flagellum, a large median spot on the front face of the pronotum, a transverse spot at apex of the scutellum and a transverse line at base, both being connected by a central line, a spot on the lateral mesothoracic lobes, a large triangular spot extending from the anterior margin of the middle lobe, and a spot at the apex of the metanotum, black. The abdomen is oblong-oval, the petiole a little more than three times as long as thick, the dorsal segments tinged with brown. The hind femora are about thrice as long as wide and armed with nine large, black teeth.

Brazil: Corumba, in May. One specimen.

Brazil.

OCTOSMICRA Ashmead, gen. nov.

This genus comes near *Protoceras* Kirby, agreeing with it in having the hind femora armed with eight large teeth, but differs in having the parapsidal furrows distinct, entire; the plate at the apex of the scutellum is emarginate or bidentate, while the abdomen, in the female, is lanceolate or conically produced, the eighth segment usually long or styliform.

OCTOSMICRA ATTALICA (Walker).

Smiera attalica Walker, Trans. Ent. Soc. London (3), II., 1864, p. 193, 3. Smiera attalica Dalla Torre, Cat. Hym., V., 1898, p. 375.

Brazil.

OCTOSMICRA NIGROACMULATA, sp. nov.

Male.—Length 8 mm. Yellowish-red; the scrobes, a dot on face, a dot on the clypeus, the teeth of mandibles, a spot on middle of the pronotum anteriorly, a large triangular spot on the middle mesothoracic lobe, a spot on each lateral lobe, a transverse spot at base of the scutellum, another near the apex, a spot at base of the metanotum connected with a median line, a line along the front margin of the mesopleura, the femoral furrow, and the flagellum, black. The triangular black spot on the middle mesothoracic lobe is interrupted by a reddish spot anteriorly. Wings hyaline, the veins testaceous. The hind femora are armed with eight teeth,

the teeth tipped with black; the first or basal tooth is long, acute, the following triangular, about equal in size.

Brazil: Chapada, in May. One specimen.

OCTOSMICRA TRIMACULATA, sp. nov.

Female.—Length 10 mm. Yellowish-red, with a spot on each lateral lobe of mesonotum and at the apex of the scutellum, black. The body of the abdomen is conically pointed, the terminal segment styliform, the sheaths of the ovipositor at apex and the ovipositor, black; the dorsal segments are stained with brown or blackish marks. The femoral furrow of the mesopleura has a black spot low down, but otherwise, except as noted, the thorax is immaculate. The hind femora are as in O. nigromaculata, except that the teeth, after the first, are not nearly equal in size, the second tooth being small, the eighth tridentate at apex or tricuspidated, so that the femora appear as if ten-dentate.

Brazil: Corumba in May. One specimen.

HEPTASMICRA Ashmead, gen. nov.

The hind femora in this genus are armed with seven large teeth, the second usually reduced in size and sometimes tricuspidate: the abdomen is fusiform or conically produced, rarely ending in a stylus; while the mandibles in the female are bidentate, in the male tridentate.

Smiera obliterata Walker, Journ. Entom., I., 1861, p. 175, ♀ ♂.

Smicra obiterata Dalla Torre, Cat. Hym., V., 1898, p. 380.

Brazil: Santarem; Chapada; Corumba; Rio de Janeiro.

HEPTASMICRA PERSIMILIS, sp. nov.

Female.—Length 11 mm. Reddish-yellow, with black marks as in *H. lineati-coxis*, except that the black on the middle mesothoracic lobe is interrupted by a reddish-yellow spot anteriorly, the hind coxæ being immaculate, while the dorsal abdominal segments are banded with black.

The body of the abdomen is much larger and longer than in *H. lineaticoxis*, the petiole being about five times as long as thick.

Brazil: Santarem. One specimen.

HEPTASMICRA AFFINIS, sp. nov.

Female.—Length 9.2 mm. Colored as in H. lineaticoxis, except the back of the head, the forehead and the scrobes are wholly black; the hind coxæ have two black stripes instead of one; the hind femora have a black band at base, along the lower margin, besides a spot on the *inner* face; while the hind tibiæ, except at the basal third, are black.

The abdomen is totally different in shape; it is lanceolate, much longer than the head and thorax united, with a very short petiole, which is wider than long; the dorsal segments are banded with black.

Brazil: Santarem. Two specimens.

HEPTASMICRA LONGICAUDATA, sp. nov.

Female.—Length 8.5 mm. Colored as in *H. lineaticoxis*, except that the hind coxæ are immaculate except at extreme apex above, while the hind tibiæ are black or dark fuscous, with a yellowish annulus before the middle.

The abdomen is long, lanceolate and terminates in a long, compressed stylus, as long as the previous segments united; the petiole is very short, wider than long.

Brazil: Maruru, in April. One specimen.

HEPTASMICRA LINEATICOXUS, sp. nov.

Female.—Length 9.5 mm. Reddish-yellow; a transverse spot on the occiput, a spot in the frontal depression, the flagellum, a triangular spot on the scutellum extending from its apex, an oblong spot on the lateral mesothoracic lobes anteriorly, the middle mesothoracic lobe, except the outer margins broadly, the sheaths of the ovipositor, and a line on the hind coxæ above, black.

The body of the abdomen is long-ovate, the petiole very long, six or more times longer than thick. The hind femora are armed with seven large teeth, the first three very acute, the following broader and rounded at apex.

Brazil: Santarem. Four specimens.

HEPTASMICRA QUADRIMACULATA, sp. nov.

Male.—Length 6 mm. Yellow; a line on the scape above, the flagellum, two triangular spots on the anterior margin of the middle mesothoracic lobe, a small spot on each of the lateral lobes and the terminal ventral segment, black.

The abdomen is long-ovate, the petiole a little more than twice as long as thick; the dorsal segments are more or less marked with brown or fuscous stains. The hind femora are armed with seven black tipped teeth, all large, except the second, which is small.

Brazil: Corumba, in May.

Genus METADONTIA Ashmead.

METADONTIA FLAVOLINEATA, sp. nov.

Female.—Length 7 mm. Black; a dot between the ocelli, front orbits, cheeks pronotum above, a line on each side of the middle mesothoracic lobe, abbreviated posteriorly, a transverse line at base of the scutellum, another at apex, the metathorax, a spot beneath the tegulæ, the front legs from the tips of the femora, the middle tarsi, the hind coxæ, except apices and a broad line beneath, a transverse line near apex of hind femora both outwardly and inwardly, an annulus on the hind tibiæ near the middle, the abdomen at base, including the petiole and second segment, and an elongate spot at tip of abdomen above, yellow.

The ridge or plate at the apex of the scutellum is emarginate and wholly yellow. Brazil: Santarem. One specimen.

Resembles Metadontia (Chalcis) nigricornis Fabr. but differs in the color of the hind legs and by the emarginate plate at apex of the scutellum.

METADONTIA SIMILIS, sp. nov.

Male.—Length 5 mm. Colored very much as in M. flavolineata, but the pronotum above, although yellow, has a black spot at the sides posteriorly; the scutellum is margined all around with yellow, the axillæ being black; the metathorax, except a central black spot, is yellow; the front and middle legs, except the first joint of the trochanters above and the base of the femora above for about two thirds their length, are yellow; the hind coxæ except at basal third are black: the hind femora are mostly yellow, but outwardly have a large black spot at base, connected with a black line beneath, above on the ridge is a black line at the basal two thirds, which itself is connected with a black line on the inner face: the inner face has also a black spot; the hind tibiæ are black except the apical two thirds of the outer face; the hind tarsi are yellow.

The abdomen is yellow, the dorsal segments banded with black.

Brazil: Santarem. One specimen. Allied to *M. nigricornis* Fabr.

METADONTIA AFFINIS, sp. nov.

Female.—Length 6 mm. Black and marked with yellow much as in *M. similis*. The front orbits, the cheeks, scape entirely, pronotum above, except a small black spot on each side, a line on each side of the middle mesothoracic lobe clear to the base of the scutellum, the outer margins of the lateral lobes, the sides and apex of the scutellum, except a median black spot on the emarginate plate at apex, yellow.

The legs are as in *M. similis* except that the hind femora are black, with a curved yellow line on outer face near apex, the base being margined with yellow, within similarly marked; femoral teeth, two and three small, the others larger. The abdomen is mostly black, the petiole yellow, the second segment (first body) reddish except at apex above.

Brazil: Santarem. One specimen.

HEXASMICRA Ashmead, gen. nov.

In having the hind femora armed with six large teeth this genus comes nearest to *Metadontia* Ashm., but is easily separated from it by the totally different shaped abdomen, which is lanceolate or fusiform, longer than the head and thorax united, the petiole being short, not longer than thick. The scutellum at apex is usually bidentate or emarginate.

HEXASMICRA TRANSVERSA (Walker).

Smiera transversa Walker, Journ. Entom., I., 1861, p. 182, \mathcal{S} . Smiera transversa Dalla Torre, Cat. Hym., V., 1898., p. 383.

Brazil: Ega; Tapayos (Mr. Bates); Chapada; Santarem. Two female and seven male specimens.

? HEXASMICRA TRINIDADENSIS, sp. nov.

Female.—Length 4 mm. Yellow; a transverse spot on the occiput, the flagellum above, a transverse line at base of scutellum, the femoral teeth and the apex of the hind tibiæ black. The abdomen is fusiform, the petiole at least five times as long as thick, the middle dorsal segments stained with black or fuscous. The hind femora are armed with six large teeth, the first four acute, the last two broad, rounded at apex.

West Indies: Trinidad.

? HEXASMICRA BRASILIENSIS, sp. nov.

Male.—Length 4 mm. Yellow; a transverse spot on the occiput, the flagellum, a transverse line on the anterior margin of the middle mesothoracic lobe and a deli-

cate median line posteriorly, a spot on the axillæ, a median line on the scutellum posteriorly and the femoral teeth, black. The abdomen is ovate, the petiole being about three times as long as thick. The hind femora are armed with six large teeth, all acute.

Brazil: Corumba, in May.

PENTASMICRA Ashmead, gen. nov.

In this genus the hind femora are armed with five large teeth; eyes large, occupying nearly the whole sides of the head; mandibles three-dentate; while the scutellum at apex is bidentate.

PENTASMICRA APERTA (Walker).

Brazil: Santarem.

Tribe V. Dirhinini.

Genus HONTALIA Cameron.

HONTALIA CAMERONI, sp. nov.

(Plate XXXII., Fig. 4.)

Female.—Length 6.1 mm.; ovipositor 3.5 mm. Blue, with a slight greenish tinge the head and thorax coarsely punctate, the metanotum and the metapleura metallic green; abdomen æneous black, the petiole longitudinally striate, the second segment very large, smooth, impunctate, the following segments united not longer than the second and microscopically shagreened; eyes light brown; ocelli pale; antennæ brown; front and middle legs, except coxæ, ferruginous, the tarsi paler, more of a yellowish-white; hind legs æneous black, except the long coxæ which are bluish and the tarsi which are yellowish-white. Wings hyaline, tinged with yellowish, the veins light brown.

Brazil: Santarem. One specimen.

Named in honor of Mr. Peter Cameron.

HONTALIA KIRBYI, sp. nov.

(Plate XXXII., Fig. 5.)

Male.—Length 3.5 mm. Æneous black, reticulately punctate, the mesopleura with an opaque, shagreened depression that extends from the tegulæ to the middle coxæ, the metanotum with several carinæ; the hind tarsi, the front and middle legs, except coxæ, the thickened portion of the femora, and a large part of the tibiæ basally are honey-yellow or testaceous; the abdominal petiole is longitudinally striate, the second abdominal segment, except apically, being smooth and polished, the apex of the second segment and the following segments are finely microscopically punctate.

Brazil: Santarem. Two specimens.

FAMILY LXIII. EURYTOMIDÆ.

Tribe I. A.vimini.

Genus AXIMA Walker.

TABLE OF SPECIES.

1. M	Iales	
\mathbf{F}	'emales.	
	Wings hyaline, without a blackish band at base	
	Wings hyaline, with a broad blackish band at base.	
	Front leas except tips of the tibige red	A eninifrance Walker

Pronotum wholly black: frontal spines distinct but not acute. Antennæ, except a streak on the scape beneath and at base, and the legs, except knees, tibiæ and tarsi, black; knees, tibiæ and tarsi honey-yellow, the middle and hind tibiæ faintly dusky Frontal spines long, acute, twice longer than wide at base. Trochanters, knees, tips of tibiæ and tarsi, honey-yellow; abdomen with a reddish spot on sides 4. Face below antennæ, sides of pronotum, sides of the fifth abdominal segment and most of the sixth, red; trochanters, knees, tips of tibiæ and the tarsi, honey-yellow; antennæ rather short, black, except the scape at base; scutellum and metanotum sometimes reddish......A. brevicornis, sp. nov. 5. Frontal spines indistinct, nearly obsolete 6 6. Wholly black, except the legs, the knees, tibiæ and tarsi honey-yellow, the middle and hind tibiæ sometimes dusky or fuscous medially; antennæ long, the funicle joints long, contracted medially,

AXIMA SPINIFRONS Walker.

Axima spinifrons Walker, Trans. Ent. Soc. London (3), I., 1862, p. 374.—Kirby,
 Journ. Linn. Soc. Zool., XVII., 1883, pl. 57; Pl. 3, f. 19.—Dalla Torre, Cat.
 Hym., V., 1898, p. 35.

Brazil: St. Paul.

AXIMA KOEBELEI, sp. nov.

Female.—Length 4.5 mm. Black; scape beneath and basally, tegulæ, trochanters, knees, tips of tibiæ and the tarsi honey-yellow; pronotum, except a median stripe, and spots on sides of the fifth and the sixth abdominal segments, red.

The frontal spines are large, acute, and fully twice as long as wide at base.

Type.—Cat. No. 6394, U. S. N. M.

Brazil: Bonito Prov., Pernambuco. (Mr. Albert Koebele.)

AXIMA BRASILIENSIS, sp. nov.

Female.—Length 4.5 mm. Resembles A. koebelei, but differs in color. It is black, with the face below the antennæ, the cheeks, the pronotum except a median stripe, the metathorax at apex and at sides, and the sides of the fourth and fifth abdominal segments, red; trochanters, knees, tips of tibiæ and the tarsi, honey-yellow.

Type.—Cat. No. 6395, U. S. N. M.

Brazil: Bonito Prov., Pernambuco. (Mr. Albert Koebele.)

AXIMA BREVICORNIS, sp. nov.

Female.—Length 4 to 4.6 mm. Black; the face below the insertion of the antennæ, the sides of the pronotum, the prosternum, sometimes the metapleura and the

sides of the fifth and sixth abdominal segments, more or less, red; scape at base, tegulæ, trochanters, knees, tibiæ and tarsi, honey-yellow; the tibiæ are sometimes dusky except at tips. Wings hyaline, the veins brown.

The frontal spines are very minute, nearly obsolete, only represented by a carina close to the eye.

Male.—Length 3-4 mm. Black, with the second joint of the trochanters, the front tibiæ, usually entirely, the tips of middle and hind tibiæ, and all tarsi, honeyyellow. The flagellum in this sex is very long, extending to the apex of the abdominal petiole, the joints of the flagellum long, contracted at the middle, each joint of the funicle with two whorls of long hairs. The apex of the metathorax has a quadrate area just above the insertion of the petiole while the petiole is very long, narrowed towards apex, shagreened, and with some longitudinal ridges or carinæ.

Brazil: Chapada, in April; Corumba; Santarem.

Described from two female and five male specimens.

AXIMOPSIS Ashmead, gen. nov.

Allied to Axima Walker, but easily separated by the different venation and by the totally different shape of the abdomen. The marginal vein is much shorter than it is in Axima, being hardly twice the length of the stigmal vein, while the abdomen is much shorter, never long lanceolate, the relative length of the segments being totally unlike those in Axima, with a much shorter petiole. The head, too, is different, not so acutely horned, the lateral ocelli being nearer to the eye margin than to each other; in Axima the ocelli are nearer to each other than to the eye margin.

AXIMOPSIS MORIO, sp. nov.

(Plate XXXII., Fig. 6.)

Female.—Length 4.2 mm. Black; the sutures between the femora and tibiæ, the extreme tips of tibiæ and the tarsi honey-yellow. Wings hyaline, bare, the tegulæ black, veins yellowish. The head is wider than the thorax, has a carina extending around the inner orbits, another bounded the scrobes and extending to the clypeus; otherwise it is much as in Axima, only not so transverse, the malar space being larger.

TRIBE II. Isosomini.

Genus ISOSOMODES Ashmead.

Isosomodes brasiliensis, sp. nov.

(Plate XXXIII., Fig. 1.)

Female.—Length 3.5 mm. Black; the scape, pedicel, first joint of funicle, except sometimes at apex, the tegulæ, the trochanters, the tibiæ and the tarsi, honey-

yellow. Wings hyaline, the veins brownish-yellow. The abdomen is long, conicovate, a little longer than the head and thorax united, subcompressed, smooth and shining, the petiole short, rugose, not or hardly longer than thick.

Brazil: Corumba, in May; Santarem. Five specimens.

Isosomodes nigriceps, sp. nov.

(Plate XXXIII., Fig. 2.)

Male.—Length 4.5 mm. Brownish-yellow, the head above, the abdominal petiole, a spot at base of second dorsal abdominal segment, a spot at apex of the third and fourth dorsal segments, all the following segments above, black; eyes brown, the ocelli red. The head has a deep frontal channel; the antennæ are long, filiform, inserted a little above the middle of the face, the scape reaching beyond the ocelli, the pedicel of same being very short, the funicle joints long, about two thirds the length of the scape, briefly pedicellate and with two whorls of long, black hairs as in Isosoma.

Brazil: Santarem. One specimen.

Genus ISOSOMA Walker.

Isosoma orchidearum Westwood.

Isosoma orchidearum Westwood, Gardener's Chron., 1869, p. 330.—Westwood, Trans. Ent. Soc. London, 1882, p. 323, ♀ ♂; Pl. 13, f. 1. ♂, 4 ♀.—Fitch, Trans. Ent. Soc. London, 1884, Proc., p. xi.—MacLachlan, Trans. Ent. Soc. London. 1884, Proc., p. xiv.—Riley, Insect Life, I., 1898, p. 121.—Riley, Insect Life, II., 1890, pp. 250, 251.—Dalla Torre, Cat. Hym., V., 1898, p. 349.

Brazil: Living in buds of Cattleya sp.

This is probably not a true *Isosoma*.

Tribe III. Eurytomini.

Genus CHRYSEIDA Spinola.

CHRYSEIDA AMAZONICA Westwood.

Chryseida amazonica Westwood, Thesaus. Ent. Oxon., 1874, p. 140; pl. 26, f. 5, ♀.
—Dalla Torre, Cat. Hym., V., 1898, p. 352.
Brazil.

CHRYSEIDA CYANEA (Fabricius).

Chalcis cyanea Fabricius, Syst. Piez., 1804, p. 164, \,\text{\text{\text{\text{.}}}}.

Chryseida cyanea Ashmead, Proc. Ent. Soc. Washington, III., 1895, p. 106, ♀.— Dalla Torre, Cat. Hym., V., 1898, p. 352.

Brazil: Chapada. A single female specimen taken in April.

CHRYSEIDA SUPERCILIOSA Spinola.

Chryseida superciliosa Spinola, Mag. de Zool., X., 1840, p. 12. ♀, T. 42.—Rev. Zool., 1840, p. 18.—Westwood, Thesaur. Ent. Oxon., 1874, p. 140.—Dalla Torre, Cat. Hym., V., 1898, p. 352.

British Guiana.

CHRYSEIDA ÆNEIVENTRIS, Sp. nov.

(Plate XXXIII., Fig. 3.)

Female.—Length 6 mm. Head and thorax blue, coarsely punctate, the disk of the metathorax, the mesopleura, coxæ, and the punctures along the eyes and on the face, metallic green; flagellum black, the basal two thirds of the scape at least beneath, yellow; third joint of the flagellum fully three and one half times as long as thick, legs rufous, the coxæ metallic greenish, the tarsi yellowish; abdomen æneous or bronzed, the last segment bluish. Wings hyaline, the veins yellowish.

Brazil: Santarem; Chapada, in April.

Genus BEPHRATA Cameron.

BEPHRATA STRIATIPES, sp. nov.

(Plate XXXIII., Fig. 4.)

Female.—Length 6.5 mm. Black, coarsely punctate; the face, except the scrobes, the cheeks, the temples, a large oblong spot on each side of the pronotum, the tegulæ, and the legs, except black stripes on the front and middle femora above, and the hind femora which are black, except at tips, are yellow. Wings hyaline, with a fuscous cloud beneath the marginal vein.

The abdomen is much compressed, about as long as the head and thorax united; seen from the side it is nearly as wide as long, the eighth segment represented by an aculeus; the fourth and fifth segments have a band of faint punctures before the middle, the sixth segment is punctured along the base, while the seventh segment is punctured towards the apex.

Brazil: Para, in June. Two specimens.

AXIMOGASTRA Ashmead, gen. nov.

This genus comes nearest to *Bephrata* Cameron, but is easily separated by the totally different shape of the abdomen which is long-lanceolate and compressed, much as in *Axima* Walker, by the first joint of the funicle, although long, being shorter than the scape, and by the venation, which is nearly as in *Isosoma* Walker

AXIMOGASTRA BAHIÆ, Sp. nov.

(Plate XXXIII., Fig. 5.)

Female.—Length 5.5 mm. Yellow, umbilicately punctate; a large spot on dorsum of pronotum posteriorly, a stripe on the scutellum, the mesopleura medially, and the metathorax, black. Wings hyaline, the veins yellowish. The long, lanceolate, much compressed abdomen, which is longer than the head and thorax united, is yellow, with some of the dorsal segments marked with black, the last two segments being mostly black.

Type.—Cat. No. 7342 U. S. N. M.

Brazil: Bahia. Collected by Mr. Albert Koebele, March 19, 1883.

PRODECATOMA Ashmead, gen. nov.

This is another singular genus. In its cephalic and thoracic characters it resembles *Decatoma* Spinola, while in venation and in its abdominal characters it is not unlike *Eurytoma* Illiger. Both mandibles are three-dentate, the two outer teeth acute, the inner tooth blunt; the marginal vein is long, slender, the postmarginal being very long, much longer than the marginal, while the stigmal vein, with its knob, is only about half as long as the marginal; the abdomen is compressed, not or hardly longer than the head and thorax united, usually shorter; seen from the side it is broadly oval or short ovate, usually pointed at apex, the petiole being slender and either short or long; the hind tibiæ are fringed with stiff bristles behind as in *Decatoma*.

PRODECATOMA BRUNEIVENTRIS, sp. nov.

Female.—Length 3.5 mm. Head and thorax yellow, immaculate, umbilicately punctate; abdomen brownish; the flagellum and eyes brown black; the ocelli are placed nearly in a straight line and are sometimes encircled with black. The first joint of the flagellum is more than thrice as long as thick, the following imperceptibly shortening to the club. Legs yellow, except the apical half of the hind tibiæ which is fuscous. Wings hyaline, the veins light brown. The abdomen is short, compressed; seen from the side it is oval and hardly longer than the thorax, acutely pointed at apex.

Male.—Length 2.1 mm. Yellow, with the upper part of the head, the thorax above and the abdomen, black; the flagellum is black, the funicle joints long, contracted at the middle, each joint with two whorls of long hairs; legs yellow, with the apex of hind femora and the apical two thirds of hind tibiæ black.

Brazil: Chapada, in April and August; Santarem. Four specimens.

PRODECATOMA FLAVESCENS, sp. nov.

(Plate XXXIII., Fig. 6.)

Female.—Length 1.5 mm. Yellow, the legs much paler, the eyes brown. The first joint of the flagellum is about twice as long as thick, the second about two thirds the length of the first, the third oval, only a little longer than thick. Wings hyaline, the veins yellowish. The abdomen is subcompressed, shorter than the thorax, the petiole longer than thick.

Brazil. One specimen.

PRODECATOMA THORACICA, sp. nov.

Female.—Length 3.1 mm. The upper part of the head, the occiput, dorsum of pronotum, metathorax and the abdomen, except a spot on the sides of the fifth and sixth segments, are black, rest of body yellow, the club of the antennæ, a spot towards apex of the hind femora and the middle of the hind tibiæ being fuscous. Wings hyaline, the veins yellowish. The first joint of the funicle is long, about three and one half times as long as thick, the second a little more than twice as long as thick, the third about twice as long as thick, the following still shorter.

Brazil: Santarem. One specimen.

PRODECATOMA NIGRA, sp. nov.

Female.—Length about 4 mm., the abdomen acutely pointed. Wholly black, except the legs, which are yellow, with the coxæ black, the femora more or less black or brown, except at tips, eyes brown: ocelli red.

Brazil: Santarem.

Genus EURYTOMA Illiger.

EURYTOMA ARGENTATA Cameron.

Eurytoma argentata Cameron, Biol. Centr.-Am. Hym., I., 1884, p. 108.—Dalla Torre, Cat. Hym., V., 1898, p. 334.

Guyana.

EURYTOMA CUCLUS Walker.

(Plate XXXIV., Fig. 1.)

Sosxetra transversa Walker, Trans. Ent. Soc. London (3), I., 1862, p. 37, Q.

Eudoxinna transversa Walker, Trans. Ent. Soc. London (3), II., 1864, p. 207. — Westwood, Thes. ent. Oxon., 1874, p. 138; Pl. 25, f. 9, ♀. — Dalla Torre, Cat. Hym., V., 1898, p. 352.

Brazil: Ega; Benevides in July. One female.

In the Herbert H. Smith collection is a single male, taken at Chapada in April, which I think is the male of this species. It measures only 3.2 mm., is yellow with a spot on the vertex enclosing the ocelli, a spot at apex of scutellum, a spot at apex of the hind femora, the apical two thirds of the hind tibiæ, a stripe along the petiole above, and the body of abdomen above, black. The antennæ are inserted far up on the face, the scape being long and extending beyond the ocelli, with a minute tooth at apex beneath; the flagellum is similar to that in the males of Isosoma, each of the funicle joints having two whorls of long hairs. The abdomen is longly peti-

olated, the petiole being as long as the hind femora, the body being small, triangular in outline, the third segment being the largest segment.

Genus SYSTOLODES Ashmead.

SYSTOLODES BRASILIENSIS, Sp. nov.

Female. — Length 1.5 mm. Black, the scape and the legs, except the coxe and the hind femora, honey-yellow. Wings hyaline, the veins pale yellowish.

The joints of the funicle are a little longer than thick, the first joint being a little the longest. The abdomen is subglobose, subcompressed, the petiole being slender and as large as the hind coxæ.

Brazil: Chapada, in April. One specimen. Differs from all other species placed in this genus by the long abdominal petiole.

Tribe IV. Rileyini.

NEORILEYA Ashmead, gen. nov.

Head transverse, not wider than the thorax at its widest part, the eyes large, broadly oval or subrotund, the malar space very short; mandibles short, broad, 4-dentate; antennæ thirteen-jointed, with two ring-joints, alike in both sexes, the flagellum being stout, filiform, pubescent, stoutest in the female, the pedicel shorter than the first joint of the funicle; first two joints of the funicle in the male are submoniliform. Thorax robust, the pronotum very large, subquadrate, as wide as the mesonotum or very nearly, the latter being a little the longer, with the parapsidal furrows usually vaguely defined, rarely sharply defined or complete; the metathorax is extremely short. Abdomen short oval, shorter than the thorax, depressed, wider than deep, subsessile, the petiole very short, the first and third body segments the longest, nearly equal, the second very short, the fourth and the fifth longer than the second, the following more or less retracted.

In sculpture this genus agrees with Eurytoma, being umbilicately punctate.

NEORILEYA FLAVIPES, sp. nov.

(Plate XXXVI., Fig. 2.)

Female.—Length 2.3–2.6 mm. Robust, black, umbilicately punctate, the abdomen oval, slightly depressed and delicately shagreened; scape and legs pale yellowish, rarely with the hind femora and tibiæ toward apex blackish, or dusky; flagellum filiform, the funicle joints two to six quadrate. Wings hyaline, the tegulæ and veins yellowish or brownish-yellow. The male is usually smaller, with

the abdomen more depressed, the pedicel as well as the scape being yellow; otherwise it is hardly distinguishable from the female.

Brazil: Chapada; Santarem. Ten specimens.

Genus RILEYA Ashmead.

RILEYA ORBITALIS, sp. nov.

Female.—Length 2 mm. Head and thorax, except the pronotum which is more or less brownish or yellowish, mostly black, the abdomen brown, the apex black; orbits, face below antennæ, scape, tegulæ, and the legs, except the basal half of the hind femora, yellow or brownish-yellow, the tips of the tibiæ and the tarsi paler or yellowish-white; flagellum subclavate, light brown, joints five and six of funicle wider than long. Wings hyaline, the veins pale yellowish; the marginal vein is a little more than twice the length of the stigmal, the postmarginal vein being long,

The abdomen is conic-ovate, cylindrical, nearly twice the length of the thorax, pointed at apex, the third segment very large, occupying the greater part of the whole surface of abdomen.

Brazil: Santarem.

FAMILY LXIV. PERILAMPIDÆ.

Genus PERILAMPUS Latreille.

PERILAMPUS BRASILIENSIS, sp. nov.

(Plate XXXIV., Fig. 4.)

Female. — Length 4.8–5 mm. Blue, the head behind the ocelli, the fore part of the middle mesothoracicl obe, and the inner front angle of the lateral lobes æneous; the head is smooth with several longitudinal striæ between the eyes and the scrobes, the pronotum coarsely, irregularly punctate, the middle mesothoracic lobe and the scutellum coarsely transversely striate, the lateral mesothoracic lobes with some long, oblique striæ posteriorly. The extreme tips of the tibiæ and the tarsi are testaceous.

Brazil: Chapada, in April. Two specimens.

FAMILY LXV. EUCHARIDÆ.

Genus EUCHARIS Latreille.

EUCHARIS DICERODERA Spinola? = Kapala.

Eucharis dicerodera Spinola, Mem. Acad. Sc. Torino (2), XIII., 1851, p. 43, ♂.—Dalla Torre, Cat. Hym., V., 1898, p. 360.

Brazil.

Genus ORASEMA Cameron.

Orasema festiva (Fabricius).

Eucharis festiva Fabricius, Syst. Piez., 1804, p. 157.

Orasema festiva Kirby, Journ. Linn. Soc. London, Zool., XX., 1886, p. 29.— Dalla Torre, Cat. Hym., V., 1898, p. 361.

Brazil.

ORASEMA RAPO (Walker).

(Plate XXXIV., Fig. 5.)

Eucharis rapo Walker, Monogr. Chalc., II., 1839, p. 66, ♀.

Orasema rapo Kirby, Journ. Linn. Soc. London, Zool., XX., 1886, p. 26. — Dalla Torre, Cat. Hym., V., 1898, p. 361.

Brazil: Chapada, in April; Santarem; Corumba, in May. Fifteen specimens.

PSEUDOCHALCURA Ashmead, gen. nov.

This genus resembles *Chalcura* Kirby, but the wings are hyaline, *without* a fuscous spot, and the antenne, in the male, have only *four* branches.

PSEUDOCHALCURA NIGROCYANEA, sp. nov.

(Plate XXXIV., Fig. 6.)

Male.— Length 3.5 mm. Blue-black, coarsely, reticulately punctate, with a faint æneous tinge above, the trochanters, apices of femora and all tibæ and tarsi, and the scape and pedicel of antennæ honey-yellow, the flagellum brown-black or brown, paler towards apex, joints one to four each with a long branch above. The abdomen is æneous black, with a very long petiole, the length of the hind femora, the body subcompressed, viewed from the side subtriangular.

Female. — Length about 4 mm. Agrees fairly well with the male except that the flagellum is brown, joints one to four acutely lobed above, while the abdomen is larger, the petiole much shorter, being hardly two thirds the length of the hind femora.

Brazil: Chapada, in April. Six specimens.

Genus STIBULA Spinola.

STIBULA NIGRICEPS, sp. nov.

(Plate XXXV., Fig. 2.)

Male.— Length 3 mm. Brownish-yellow, the head, except the eyes which are brown, being entirely black; the flagellum from the second joint is brown-black, the scape, pedicel, and the first joint of the flagellum being yellow; the first joint of the flagellum is very long, more than twice as long as the scape.

The thorax is brownish-yellow marked with black as follows: The middle mesothoracic lobe has two oblong, nearly confluent, spots anteriorly, the lateral lobes have a spot above, while the scutellum has a transverse line across the base and a central line ending on the two spines at the apex of the scutellum, black. The abdominal petiole and the legs are yellow.

Brazil: Santarem, in April. One specimen.

Genus SCHIZASPIDEA Westwood.

SCHIZASPIDEA MACULATA Westwood.

Schizaspidea? maculata Westwood, Thesaur. ent. Oxon., 1874, p. 153, ♀; Pl. 28, f. 1. Orasema maculata Kirby, Journ. Linn. Soc. London, Zool., XX., 1886, p. 29.—Dalla Torre, Cat. Hym., V., 1898, p. 361.

Brazil.

SCHIZASPIDEA PRETENDENS Walker.

Schizaspidea pretendens Walker, Trans. Ent. Soc. London (3), I., 1862, p. 385, &.—Dalla Torre, Cat. Hym., V., 1898, p. 364.

Brazil: Chapada, in May. One specimen, badly damaged.

Genus TETRAMELIA Kirby.

TETRAMELIA MERIDIONALIS Kirby.

Thoracantha flabellatus Westwood, Proc. Soc. London, III., 1835, p. 52, 3.

Thoracantha aculeata Westwood, opus cit., 1835, Q.

Chalcis (Thoracantha) aculeata Blanchard, Cuvier: Règne anim., Ed. 3ª, Ins., II. 1849; T. 113, f. 8.

Thoracantha aculeata Westwood, Thesaur. ent. Oxon., 1874, p. 154; Pl. 28, f. 9.

Lasionychus flabellatus Shipp, The Entom., XXV., 1894, p. 188. — Dalla Torre, Cat. Hym., V., 1898, p. 367.

Brazil: Santarem. Five specimens.

Genus DICŒLOTHORAX Ashmead.

Allied to Lætočantha Shipp, but easily distinguished by the deep impressions on the mesonotum and the scutellum, and by the very broad and different shape of the scutellar processes, which form a broad shield over the abdomen.

DICCELOTHORAX PLATYCERUS, sp. nov.

(Plate XXXV., Fig. 3.)

Female. — Length 3.8 mm. Æneous black, the antennæ, the legs, except the coxæ and a median longitudinal stripe on the closely united scutellar projections, testaceous. The disk of the mesonotum and the scutellum are concavely excavated, the bottom of the concavities being smooth and highly polished, the scutellar processes being longitudinally striated. The pronotum is greatly elevated and coarsely

transversely striated. The head is coarsely shagreened, with some irregular elevated lines. The antennæ are short, the first joint being very long, clavate, about the length of the scape, or nearly as long as all remaining joints united, the second funicle joint only a little longer than thick, the following transverse.

The male differs from the female only slightly in the antennæ. The first joint of the flagellum is a little shorter about the length of the flagellum, the funicle joints two to four being much wider, subdentate above.

Brazil: Santarem. Two specimens.

Genus DILOCANTHA Shipp.

DILOCANTHA FLAVICORNIS (Walker).

Thoracantha flavicornis Walker, Trans. Ent. Soc. London (3), I., 1862, p. 382.—Westwood, Thesaur. ent. Oxon., 1874, p. 153; Pl. 28, f. 3.

Dilocantha flavicornis Shipp, The Entom., XXVII., 1894, p. 184.—Dalla Torre, Cat. Hym., V., 1898, p. 366.

Brazil: Villa Nova (Bates).

Genus ISOMERALIA Shipp.

ISOMERALIA CORONATA (Westwood).

Thoracantha coranata Westwood, Thesaur. ent. Oxon., 1874, p. 154; Pl. 28, f. 10. Isomeralia coranata Shipp., The Entom., XXVII., 1894, p. 188.— Dalla Torre, Cat. Hym., V., 1898, p. 366.

Brazil: Bonito Provence, Pernambuco (Albert Koebele).

Genus LIRATA Cameron.

LIRATA BATESELLA (Westwood).

Thoracantha batesella Westwood, Thesaur. ent. Oxon., 1874, p. 154; Pl. 28, f. 8, ♂.

—Dalla Torre, Cat. Hym., V., 1898, p. 365.

Brazil: Santarem. One male specimen.

LIRATA PALLESCENS (Walker).

Thoracantha pallescens Walker, Trans. Ent. Soc. London (3), I., 1862, p. 380, 3.

Lirata pallens Shipp, The Entom., XXVII., 1894, p. 188.—Dalla Torre, Cat. Hym.,
V., 1898, p. 367.

Brazil: Villa Nova (Bates); Chapada, in March and November. Four specimens, two males.

The female has not been described. It may be easily recognized by the difference in the antennæ; the first joint of the funicle is very long, as long or a little longer than the scape, or nearly as long as all the remaining joints united, acute at apex above, joints two to four of funicle short but also acute at apex above.

LIRATA SURGENS (Walker).

Thoracantha surgens Walker, Trans. Ent. Soc. London (3), I., 1862, p. 384, 3.

Lirata surgens Shipp, The Entom., XXVII., 1894, p. 188.—Dalla Torre, Cat. Hym., V., 1898, p. 367.

Brazil: Santarem.

Genus KAPALA Cameron.

KAPALA ALTA (Walker).

Colombia.

KAPALA STRIATISSIMA (Walker).

Thoracantha striatissima Walker, Trans. Ent. Soc. London (3), I., 1862, p. 380, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 366.

Brazil: Santarem (Mr. Bates).

KAPALA SPLENDENS Sp. nov.

(Plate XXXV., Fig. 4.)

Female.—Length 8–8.5 mm. Very robust, the head and thorax brilliant metallic green, the abdomen blue or blue green, with æneous reflections, usually brassy above, the antennæ and the legs except the coxæ, yellowish, the wings subfuscous, the veins brown. The face is longitudinally striate, the striæ becoming transverse below the insertion of the antennæ, the thorax coarsely transversely striate, the scutellum and the scutellar processes longitudinally striate.

Brazil: Chapada, in April and November. Four specimens.

This is the largest and most brilliant of any Eucharid yet discovered.

Genus LASIOKAPALA Ashmead.

Allied to *Kapala* Cameron, but easily distinguished by being hairy or pubescent, and by the smoothness of the head. The lateral lobes of the mesonotum and the

scutellum, including the long processes, are also smooth, not striate; the scutellar processes are transversely striate or serrate at their apices.

LASIOKAPALA SERRATA, sp. nov. (Plate XXXV., Fig. 5.)

Female.—Length 3.5 mm. Æneous black; the antennæ, the long scutellar processes and the legs are honey-yellow. The head in front is smooth without striæ; the thorax is hairy or pubescent, perfectly smooth, except the middle mesothoracic lobe above which is coarsely, transversely striate; the middle lobe and the scutellum have a deep depression on their disks; while the long scutellar processes are smooth to near their apices, their apices or tips above are laterally transversely striate or serrate.

Brazil: Chapada.

FAMILY LXV. MISCOGASTERIDÆ.

Subfamily I. Pireninæ.

Genus HERBERTIA Howard.

HERBERTIA HOWARDI, sp. nov.

(Plate XXXV., Fig. 6.)

Female.—Length 2.4 mm. Blue black, the thorax above with a slight æneous tinge; eyes very large, brown, pubescent; scape honey-yellow, the flagellum brownblack; tibiæ and tarsi pale yellow. The head and thorax above are shagreened or feebly punctate, pubescent; the mesopleuron has a broad, rather deep sulcus; the wings are hyaline, the veins brownish, the stigmal vein very small, the marginal vein very long, while the postmarginal vein is also long. The abdomen is ovate, a little longer than the thorax, the first body segment being the longest and occupying nearly the half of the whole surface, the following segments very short, subequal in length.

Brazil: Rio de Janeiro in August. One specimen.

HERBERTIA BRASILIENSIS, sp. nov.

Female.—Length 1.6 mm. Head and thorax bluish, the abdomen æneous black; ocelli reddish-yellow; eyes large, hairy; flagellum brown-black; tibiæ and tarsi yellowish-white. The head and the thorax are only feebly shagreened, the lateral mesothoracic lobes being almost smooth; the wings are hyaline, the veins as in H. howardi except paler in color. The abdomen is ovate, pointed at apex, on

account of the sheaths of the ovipositor projecting slightly, but not longer than the thorax.

Brazil: Chapada, in April.

SUBFAMILY II. TRIDYMINÆ.

Tribe I. Tridymini.

Genus GASTRANCISTRUS Westwood.

GASTRANCISTRUS CEPHALON Walker.

Gastrancistrus cephalon Walker, Ann. & Mag. Nat. Hist., XI., 1843, p. 30, ♀. — Spinola, Gay's Hist. fis. Chile, Zool., VI., 1851, p. 461, ♀. — Dalla Torre, Cat. Hym., V., 1898, p. 203.

Lelaps picta Walker, Trans. Ent. Soc. London (3), I., 1862, p. 390, Q.

Lælaps picta Dalla Torre, Cat. Hym., V., 1898, p. 184.

Brazil: Ega.

LELAPS APICALIS Sp. nov.

Female.—Length 4 mm. Head, thorax and abdomen pale ferruginous, the base of the abdomen and the stylus black; scape, pedicel and antennal club pale yel-

lowish, the funicle black; legs, including coxæ, flavo-testaceous. Wings hyaline, with a curved fuscous streak at basal third, a large fuscous spot beyond this, including the disk, connected with the basal nervure and extending to the hind margin; there is a large hyaline spot beneath the marginal vein and the apex of the stigmal vein; another triangular hyaline spot at the hind margin, while the apex of the wing is also hyaline. The head and thorax are opaquely punctate, without striæ; the abdomen is conic-ovate, smooth and polished and terminates in a black, subcompressed stylus. The antennæ are subclavate, not long, the flagellum being only about twice the length of the scape, the last three joints of the funicle a little wider than long.

Brazil: Chapada, in August.

LELAPS AFFINIS, sp. nov.

Female.—Length 4 mm. Head, thorax and abdomen, except the tip of the stylus which is black, pale ferruginous; scape, pedicel, first three joints of funicle, the last joint of funicle, and the club, pale yellowish or whitish; legs, including the coxe, flavo-testaceous, the coxe and tarsi however tinged with white. Front wings hyaline, with a fuscous band across from the base of the marginal vein and enclosing the basal part of the stigmal vein; this is followed by a hyaline transverse band and then by another narrow transverse fuscous band; the apex of the wing is hyaline. The head and thorax are finely opaquely sculptured; the face above the insertion of the antennæ is finely, transversely acculate, but smooth near the eye margin; the axillæ are finely longitudinally acciculate. The abdomen is shaped as in L. apicalis.

Brazil: Santarem.

LELAPS FERRUGINEA, sp. nov.

Female. — Length 3.6–4 mm. Head, thorax and abdomen, pale ferruginous, the extreme tip of the stylus black; antennæ pale yellowish with the two last joints of the funicle and the club black; the funicle, without the pedicel, is fully three times as long as the scape; legs, including the coxæ, pale flavo-testaceous, the coxæ and the tarsi tinged with whitish, the hind tibiæ fuscous or subfuscous. Front wings mostly fuscous, the base and tips hyaline and with two wedge-shaped hyaline spots vis-à-vis across the disk, just beyond the stigmal vein, their points meeting. The head and thorax are sculptured as in L. affinis except that the axillæ are not longitudinally accidate and the posterior half of the mesopleura is perfectly smooth and highly polished.

Brazil: Santarem. Two specimens.

LELAPS ÆNEICEPS, sp. nov.

Female. — Length 3.5–4 mm. Head æneous black, the thorax and the abdomen ferruginous, the middle lobe of the scutellum basally, a band across the middle of the abdomen and the tip of the stylus, black; face striate; antennæ pale yellowish, with the last four or five joints of the funicle black; the flagellum is long, fully three times as long as the scape, the joints long, the last joint of the funicle only a little longer than thick, but the shortest joint; legs pale yellowish, the coxæ and tarsi whitish, the middle femora sometimes dusky or subfuscous basally. The front wings are hyaline, with the apex fuscous; there is also a faint fuscous streak across from the origin of the marginal vein. The abdomen is conic-ovate, produced into a rather long stylus at apex; the stylus is compressed towards apex and about as long as the large second segment, the second segment blackish or fuscous at apex.

Brazil: Chapada and Santarem.

LELAPS HALIDAYI, sp. nov.

Female. — Length 10.5 mm. Head and thorax æneous black, with a faint purplish tinge in certain lights; face coarsely striate; pronotum transversely striate, the striæ coarser on the collar; mesonotum anteriorly delicately transversely striate, the lobes posteriorly roughly punctured; scutellum striate; metanotum rugulose, bifoveolate at base. The antennæ are long, black, the scape metallic black but more or less testaceous beneath; the flagellum is about thrice as long as the scape, subclavate, pubescent, the joints elongate. The legs are testaceous, the front and hind coxæ and trochanters, base of middle tibiæ and the tarsi basally are yellowish-white, the front tibiæ at apex and the hind tibiæ at apical two thirds are fuscous. The abdomen is rufous and terminates in a long stylus, the sheaths of the ovipositor being black. The front wings are hyaline, with a large triangular fuscous spot on the disk, a large oval fuscous spot at apex and a small fuscous spot at the origin of the marginal vein.

Brazil: Rio de Janeiro, in October.

Dedicated to the memory of A. H. Haliday, Esq., the describer of the genus, and who did so much to advance the knowledge of the parasitic Hymenoptera.

LELAPS ABDOMINALIS, sp. nov.

(Plate XXXVI, Fig. 1.)

Female.—Length 8.5 mm. Head and pronotum dark blue, the rest of the thorax black or æneous black; abdomen red, with the extreme apex black; scape and pedicel of the antennæ and the legs pale testaceous, the tips of the coxæ, sutures of trochanters, knees and tarsi basally, more or less whitish, the tips of the

middle and hind tibiæ fuscous. The front wings are very similar to those in *L. halidayi*, only the fuscous spot at the apex extends all across the wing and leaving a whitish band between it and the apex of the stigmal vein. The face, pronotum and scutellum are coarsely striate.

Brazil: P. Branca, in April.

LELAPS BIMACULATA, sp. nov.

Female.— Length 3-4 mm. Head and thorax æneous black, the thorax above more or less bronzy green, the abdomen polished black; scape, pedicel, basal two or three joints of the flagellum and most of the legs pale yellowish, the coxæ basally and the femora, especially the front and hind femora, æneous black or brown, the tips of the coxæ, base of tibiæ and the tarsi basally, whitish. The front wings are hyaline, with a fuscous spot at apex and another beneath and including the stigmal vein. The abdomen, with its long stylus, is longer than the head and thorax united, the stylus alone being about two thirds the length of the body of the abdomen. The head is shining, with the face delicately longitudinally striate; the thorax is sculptured, the base of the mesonotum, the axillæ and the apex of the scutellum being striate. The antennæ are long, the flagellum being subclavate and more than three times the length of the scape, the funicle joints all longer than thick, the basal joints the longest.

Brazil: Chapada, in April; Santarem; and P. Branca.

LELAPS STYLATA, sp. nov.

Female.— Length 5.5-6 mm. Head and thorax æneous black, the thorax above sometimes bronzed green, the abdomen polished black, ending in a long stylus, which is as long as or a little longer than the body of the abdomen; scape, base of flagellum and sometimes the tip, and most of the legs, except as noted, pale yellowish, the front and middle coxæ basally, and the front femora, brown or black, the hind femora, except basally and at tips, subfuscous, the tips of hind tibiæ dusky, the hind coxæ, trochanters, all tibiæ more or less and especially basally, and all tarsi basally, more or less white or tinged with white; the stylus is sometimes testaceous basally or with only the apex black, more rarely wholly black.

Brazil: Chapada, in April; Santarem.

FAMILY LXVII. CLEONYMIDÆ.

SUBFAMILY I. CHALCEDECTINÆ.

Genus CHALCEDECTES Walker.

CHALCEDECTES HISTRIONICA (Westwood).

Polychroma histrionica Westwood, Thesaur. ent. Oxon., 1874, p. 141; Pl. 26, f. 6. Polychromatium histrionicum Dalla Torre, Cat. Hym., V., 1898, p. 186.

Brazil: Santarem. Two specimens.

CHALCEDECTES MACULICORNIS Walker.

Chalcedectes maculicornis Walker, Ann. & Mag. Nat. Hist. (2), X., 1853, p. 47, Q. Chalcodectes maculicornis Dalla Torre, Cat. Hym., V., 1898, p. 186.

Brazil: Para; Santarem. Two specimens.

CHALCEDECTES REGALIS (Westwood).

Polychroma regalis Westwood, Thesaur. ent. Oxon., 1874, p. 141; Pl. 26, f. 7. Polychromatium regale Dalla Torre, Cat. Hym., V., 1898, p. 186.

Brazil: Amazon (Bates).

CHALCEDECTES SEDECIMDENDATUS (Westwood).

Polychroma sedecimdentata Westwood, Thesaur. ent. Oxon., 1874, p. 141. Polychromatium sedecimdentatum Dalla Torre, Cat. Hym., V., 1898, p. 186. Brazil.

CHALCEDECTES SEPTEMDENTATUS (Westwood).

Polychroma septemdentata Westwood, Thesaur. ent. Oxon., 1874, p. 142. Polychromatium septemdentatum Dalla Torre, Cat. Hym., V., 1898, p. 186.

Brazil: Para (Bates).

CHALCEDECTES ANNULIPES, sp. nov.

(Plate XXXVI., Fig. 2.)

Female. — Length about 7 mm. Metallic purplish and green, with cupreous tingings, a more decided green spot on the anterior middle of the pronotum and on the disk of the scutellum, the legs metallic greenish and æneous, the hind coxæ more bluish posteriorly, the three basal joints of the tarsi and a broad band on the hind tibiæ at base, white, the terminal joints of tarsi brown or brown black. The wings are hyaline, the veins light brown, the subcostal vein yellowish towards apex. The swollen hind femora are armed with about thirteen or fourteen minute teeth. The abdomen is conic-ovate, a little longer than the head and thorax united, depressed.

Brazil: Chapada, in January; Corumba, in May.

SUBFAMILY II. CLEONYMINÆ.

Genus LYCISCA Spinola.

LYCISCA APICALIS Walker.

Lycisca apicalis Walker, Trans. Ent. Soc. London (3), I., 1862, p. 393, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 231.

Brazil: Ega (Bates); Santarem. Three specimens.

LYCISCA HASTATA Walker.

Genus CLEONYMUS Latreille.

CLEONYMUS COLLARIS Spinola.

Cleonymus collaris Spinola, Mém. accad. sc. Torino (2), XIII., 1853, p. 46, ♀. — Dalla Torre, Cat. Hym., V., 1898, p. 182.

Brazil: Para.

Genus TRIGONODERUS Westwood.

TRIGONODERUS BRASILIENSIS, sp. nov.

(Plate XXXVI., Fig. 4.)

Female. — Length 4 mm. Bronzed green, the face in front, the thorax at the sides and beneath, and the coxe bluish-green; abdomen elongate, conically pointed, much longer than the head and thorax united, blue-black, with a metallic æneous tinge at base; scape, pedical, tegulæ and legs, except as noted, honey-yellow, the hind femora dusky; flagellum brown-black. Wings hyaline, the veins yellowish.

Brazil: Chapada, in April. One specimen.

Genus EPISTENIA Westwood.

EPISTENIA ÆQUALIS Walker.

Epistenia æqualis Walker, Trans. Ent. Soc. London (3), I., 1862, p. 392, ♀. — Dalla Torre, Cat. Hym., V., 1898, p. 177.

EPISTENIA SCUTATA Walker.

Epistenia scutata Walker, Trans. Ent. Soc. London (3), I., 1862, p. 391, \circ . — Dalla Torre, Cat. Hym., V., 1898, p. 178. Brazil.

SUBFAMILY III. PELECINELLINÆ.

Genus PELECINELLA Westwood.

PELECINELLA HOWARDII Ashmead.

(Plate XXXVI., Fig. 6.)

Pelecinella howardii Ashmead, Proc. Ent. Soc. Washington, III., 1895, p. 233, ♀.— Dalla Torre, Cat. Hym., V., 1898, p. 178.

Brazil: Chapada, in November. Two specimens.

PELECINELLA PHANTASMA Westwood.

Pelecinella phantasma Westwood, Trans. Ent. Soc. London, 1868, p. xxxv.— Westwood, Thesaur. ent. Oxon., 1874, p. 142; Pl. 26, f. 8.—Ashmead, Proc. Ent. Soc. Washington, III., 1895, p. 233, ♀.

Brazil: Amazon (Bates).

PELECINELLA WESTWOODII Ashmead.

Pelecinella westwoodii Ashmead, Proc. Ent. Soc. Washington, III., 1895, p. 233, ♀. —Dalla Torre, Cat. Hym., V., 1898, p. 178.

Brazil: Chapada, in March; P. Branca, in April. Two specimens.

FAMILY LXVII. ENCYRTIDÆ.

SUBFAMILY I. EUPELMINÆ.

Tribe I. Eupelmini.

Genera OODERELLA Ashmead.

OODERELLA SMITHII Ashmead.

(Plate XXXVII., Fig. 1.)

Ooderella smithii Ashmead, Proc. Ent. Soc. Washington, IV., 1896, p. 11, ♀.— Dalla Torre, Cat. Hym., V., 1898, p. 268.

Brazil: Chapada, in April. One specimen.

Genus BRASEMA Cameron.

BRASEMA FUSCIPENNIS, sp. nov.

Female. — Length 7 mm. Uniformly dark blue, closely punctate, the mesopleura and the coxæ clothed with a white pubescence. Wings fuscous, a little paler at tips. Head very broad, lenticular, without antennal furrows; eyes brown, faintly hairy; ocelli red, arranged in a triangle; mandibles small, 3-dentate at apex; legs

concolorous with the body, the sutures of the trochanters yellowish, the tibiæ subdilated towards apex, the hind tibiæ subcompressed, ending in two short spurs, the middle tibiæ ending in one strong spur, the middle tarsi dilated with joints one to four armed with two rows of black teeth beneath.

Brazil: Santarem. One specimen.

Genus IDÓLEUPELMUS Ashmead.

IDOLEUPELMUS ANNULICORNIS Ashmead.

Idoleupelmus annulicornis Ashmead, Proc. Ent. Soc. Washington, IV., 1896, p. 13, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 271.

Brazil: Santarem. West Indies: St. Vincent.

Genus MACREUPELMUS Ashmead.

MACREUPELMUS BRASILIENSIS Ashmead.

(Plate XXXVII., Fig. 2.)

Macreupelmus brasiliensis Ashmead, Proc. Ent. Soc. Washington, IV., 1896, p. 14, Q.—Dalla Torre, Cat. Hym., V., 1898, p. 271.

Brazil: Santarem. Four specimens.

Genus ISCHNOPSIS Ashmead.

ISCHNOPSIS THORACICA Sp. nov.

Female. — Length 3.5 mm. Head metallic green, finely punctate, the face with a fine, glittering white pubescence; eyes black; antennæ, thorax, legs and abdomen honey-yellow. The abdomen is longer than the head and thorax united, and tinged with fuscous towards apex, the ovipositor short, but distinct.

Brazil: Santarem. One specimen.

ISCHNOPSIS CYANEA Sp. nov..

Female. — Length 3.5 mm. Uniformly dark blue, the thorax with a greenish tinge in certain lights, closely finely punctate, and clothed with short, scale-like, white hairs; the tibial spurs and the tarsi, except toward apex, yellowish-white, the basal joints always white; eyes large, converging above, brown and faintly pubescent. Wings hyaline, veins light brown.

Brazil: Santarem.

Genus EUPELMUS Dalman.

EUPELMUS AMERICANUS Spinola.

Eupelmus? americanus Spinola, Mem. accad. sc. Torino (2), XIII., 1851, p. 47.—Dalla Torre, Cat. Hym., V., 1898, p. 273.

Brazil: Para.

EUPELMUS AMILLARUS Walker.

Eupelmus amillarus Walker, Ent. Mag., V., 1838, p. 475, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 273.

Brazil.

EUPELMUS BASICUPREUS Walker.

Eupelmus basicupreus Walker, Ann. & Mag. Nat. Hist. (2), X., 1852, p. 45, ♀.—
Dalla Torre, Cat. Hym., V., 1898, p. 274.

Brazil: Para.

EUPELMUS EXCELLENS Westwood.

Eupelmus excellens Westwood, Thesaur. ent. Oxon., 1874, p. 149.—Dalla Torre, Cat. Hym., V., 1898, p. 276.

Brazil: Para (Bates).

EUPELMUS KOEBELEI, sp. nov.

Female.—Length 2.6 mm. Apterous and of a bluish-green color, the head in front gold-green, the abdomen blue-black, with an æneous tinge, cupreous at base and beneath, the ovipositor yellowish, with a black annulus at base and at tip; the ovipositor is hardly one third the length of the abdomen; the pronotum is bluish, with a tuft of long black hairs on the anterior middle above; legs æneous black, the sutures of the trochanters, tips of all tibiæ, a spot at base of middle tibiæ, and all tarsi, except the last joint, brownish-yellow or yellowish-white.

Type.—Cat. No. 7660, U. S. N. M.

Brazil: Bonito Prov., Pernambuco, February, 1883 (Mr. Albert Koebele).

EUPELMUS ACAUDUS, sp. nov.

Female.—Length 2 mm. Metallic green, the head on the vertex and the mesopleura blue-green; scape, pedicel and legs, including the coxæ, pale honey-yellow; flagellum brown-black. The wings are hyaline, with the veins yellowish. The abdomen conic-ovate, as long as the head and thorax united, æneous black, the ovipositor not prominent, the sheaths yellowish and only slightly projecting beyond the tip of the abdomen.

Brazil: Santarem. One specimen.

EUPELMUS PROXIMUS, sp. nov.

Female.—Length 1.6 mm. Æneous black, the head in front metallic green; scape æneous black, the pedicel at apex and beneath yellowish, the flagellum black; legs, except coxæ which are metallic, brownish-yellow, the front femora toward apex faintly dusky. The wings are hyaline, the veins yellowish. The abdomen is elongate, conically pointed, æneous black, longer than the head and thorax united, the ovipositor not prominent, the sheaths yellowish and only slightly projecting.

Brazil: Chapada, in April. One specimen.

EUPELMUS COMPRESSIVENTRIS, sp. nov.

Female.—Length 3 mm.; ovipositor about one third the length of the abdomen and broadly ringed with yellow. Head and thorax blue, with a faint greenish tinge in certain lights, the mesopleura decidedly æneous; abdomen compressed, æneous black; antennæ, except the club, and the legs, except the coxæ basally, brownish-yellow, the hind femora faintly dusky medially.

Brazil: Corumba, in March. One specimen.

EUPELMUS APRILIS, sp. nov.

Female.—Length 2 mm.; ovipositor short but distinct, the length of the basal joint of hind tarsi, testaceous. Head and thorax metallic green; antennæ black, the scape æneous black; legs except the femora, the hind coxæ, a spot at base of the front tibiæ outwardly, straw-yellow. The wings are hyaline, the veins yellowish. The abdomen is elongate, conically pointed, longer than the head and thorax united and æneous black.

Brazil: Chapada, in April. One specimen.

EUPELMUS CHAPADÆ, Sp. nov.

Female.—Length 2.8 mm.; ovipositor projecting, not ringed with yellow, but with the tip brownish. Head, thorax and abdomen metallic green, the mesopleura with a purplish tinge; antennæ except a narrow annulus at the apex of the pedicel, wholly back; legs, except the front and hind coxæ, pale ferruginous or brownish-yellow. The wings are hyaline, the veins yellowish. The abdomen is conically pointed, longer than the head and the thorax united.

Brazil: Chapada, in April. One specimen.

EUPELMUS SANTAREMENSIS, sp. nov.

Female.—Length 3.5 mm.; ovipositor about one third the length of the abdomen, ringed with yellow. Head and thorax blue or bluish-green, the head in front and the mesonotal ridges metallic-green; scape and an annulus at the apex of the pedicel, yellow; legs, except the front and the hind coxæ and more or less of their femora which are metallic blue or blue-green, pale ferruginous or brownish-yellow.

Brazil: Santarem.

EUPELMUS PERSIMILIS, sp. nov.

Female.—Length 4 mm.; ovipositor prominent, broadly ringed with yellowish-white. This species is allied to E. santaremensis, but it is slightly larger, the lateral ridges of the mesonotum, the elevated basal part of the middle lobe and the scutellum are more decidedly gold-green; the disk of the mesopleura is greener; the antennæ, except the club, are wholly yellow; while the legs, except the coxe and a

streak on the hind femora, are pale ferruginous, the apex of the hind tibiæ and their tarsi being white.

Brazil: Corumba, in May. One specimen.

EUPELMUS CORUMBÆ, sp. nov.

Female.—Length 2.5 mm.; ovipositor short, not ringed with white. Bluish-green, the anterior part of the middle mesothoracic lobe and the mesopleura posteriorly more decidedly green; antennæ, except the scape beneath, black; legs metallic brown, the coxæ blue-green, the trochanters, knees and base and tips of tibiæ, yellowish, the tibial spurs and the tarsi, except the last two joints, white or yellowish-white. Wings hyaline, the veins yellowish.

Brazil: Corumba, in May. One specimen.

EUPELMUS UNIFASCIATUS, sp. nov.

Female.—Length 3.8 mm.; ovipositor prominent, more than one third the length of the abdomen, yellowish basally, brownish towards tip but with the extreme tip yellowish. Blue, with a glittering white pubescence; prothorax and the lateral lobes of the mesonotum gold-green; antennæ black, the scape subcompressed, metallic æneous, legs æneous or bronzed, the sutures of the trochanters and the knees testaceous, the middle and hind tarsi basally whitish. Wings subfuscous, hyaline at base and with a narrow transverse band from before the origin of the stigmal vein.

Brazil: Chapada, in August. One specimen.

EUPELMUS SIMILLIMUS, Sp. nov.

Female.— Length 2 mm.; ovipositor prominent, with a broad yellowish band. Metallic green; head above smooth, æneous black; palpi white; front wings with the apical two thirds fuscous, the fuscous part with two oblique white spots, vis-à-vis, one extending from the front margin just before the stigmal vein, the other just opposite it on the hind margin, as in the West Indian E. albomaculatus; legs metallic brownish, the apices of the coxæ, the trochanters, the front and middle femora beneath, and the rest of the legs, except the base of the front and middle tibiæ outwardly, white or whitish.

Brazil: Chapada, in April. One specimen.

EUPELMUS MAGNICLAVATUS, Sp. nov.

Female.— Length 4.5 mm.; ovipositor short, only about two thirds the length the basal joint of hind tarsi, and yellowish-white. Blue, closely, finely punctate, the mesonotal depression greenish; wings hyaline, with a fuscous cloud extending from the tip of the stigmal vein into the discoidal region, then curving backwards

and connected with a faint cloud that extends from the base of the marginal vein; antennæ æneous black, ending in a large stout club which is nearly as long as the scape, the last four joints of the funicle being much wider than long; legs æneous black, the trochanters, or at least along the sutures, yellowish.

Brazil: Santarem. One specimen.

Genus PHLEBOPENES Perty.

PHLEBOPENES BASILICA (Marshall).

Prionopelma basilica Marshall, Ann. soc. ent. France, XLI., 1892, p. 71; Pl. 4, f. 2. Phlebopenes basilica Dalla Torre, Cat. Hym., V., 1898, p. 279.

Phlebopenes viridis Dalla Torre, Cat. Hym., V., 1898, p. 279.

Brazil.

PHLEBOPENES ABDOMINALIS, sp. nov.

Female. — Length to tip of abdomen 8.5–9 mm.; ovipositor about 25 or 26 mm. long. Head and thorax blue, with faint greenish tingings in certain lights; antennæ black, the scape subcompressed, æneous black; legs, except the coxæ, and abdomen pale ferruginous, the long ovipositor being black. Wings hyaline, the veins brownish.

Brazil: Rio de Janeiro, in November. One specimen.

PHLEBOPENES PERTYI, sp. nov.

(Plate XXXVII., Fig. 3.)

Female. — Length to tip of abdomen about 9 mm.; ovipositor about 27 mm. long. Head and thorax blue, the ridges of the mesonotum tinged with æneous; antennæ black; the prosternum, the legs, including all coxæ, and the abdomen pale ferruginous, the abdomen of a darker red.

Brazil: Santarem. One specimen.

This species resembles P. abdominalis, but is easily separated by the color of the coxe.

ENCYRTASPIS Ashmead, gen. nov.

This genus is at once recognized by the tuft of long black hairs on the scutellum as in the genus *Encyrtus* Latreille (= *Comys* Förster), by the shape of the head, the scrobes being very short, hardly impressed, and by the abdomen, which has the hypopygium prominent and ends in a long ovipositor.

ENCYRTASPIS BRASILIENSIS, sp. nov.

(Plate XXXVII., Fig. 4.)

Female.— Length about 4 mm.; ovipositor longer than the body, with a broad white band before the apex. Blue with greenish reflections, the head in front eneous, the abdomen æneous black, with a testaceous band near the base, the scutellum red with a tuft of long black hairs. The antennæ, except the last two or

three joints of the funicle and the club which are black or dark fuscous, are yellowish; the legs are brownish or fuscous, the trochanters yellowish, the hind tibiæ compressed, the hind margin of same being white; joints one to three of the middle tarsi and joints two and three and apex of joint one of the hind tarsi white. The front wings, except the basal one third and the apical one fourth, fuscous, the base and apex hyaline.

Type. — Cat. No. 7661, U. S. N. M.

Brazil: Pernambuco. (Mr. Albert Koebele.)

Genus ANASTATUS Motschulsky.

TABLE OF SPECIES.

1. Thorax and abdomen mostly metallic blue or green. 2 Thorax and abdomen honey-yellow, or for the greater part. Thorax honey-yellow; head gold-green, closely punctate; front wings subfuscous, the basal third a transverse band before the apex and two triangular spots, vis-à-vis, beneath the marginal Thorax yellowish but with the middle mesothoracic lobe and the metanotum bluish-green; head metallic green, closely punctate; front wings fuscous, with a band at base, and another across Metallic green, the disk of the mesonotum purplish, the mesopleura posteriorly, the ridge in front of the tegulæ, and a band at base of the abdomen honey-yellow; front wings subfuscous, the basal third and a transverse band across from the marginal vein, hyaline or white A. pleuralis, sp. nov. 3. Collar and base of abdomen not yellow..... 4 Collar and base of abdomen yellow or whitish. Head gold-green; front wings fuscous with the basal third, and a band across from before the stig-4. Abdomen finely punctate or shagreened, with a yellowish band at base; front wings fuscous, paler at tips, the basal third hyaline, the disk with a narrow transverse band from the apex of the marginal Abdomen smooth, weneous black; front wings fuscous, the basal third, and a transverse band across the

ANASTATUS AURICEPS, sp. nov.

Female.— Length 2.5–3 mm. Head metallic gold-green, punctate, the thorax, abdomen, legs and antennæ, except the club, honey-yellow, the palpi white.

The thorax and abdomen are smooth, impunctate; the metathorax has a metallic band at base, enclosing the spiracles and on the dorsum of the abdomen laterally are a few fuscous spots. The antennæ, except the club, are yellow, the flagellum subclavate, twice the length of the scape. The front wings are subfuscous, with the basal third, a transverse band before apex, and two triangular spots vis-à-vis beneath the marginal vein, hyaline or whitish.

Brazil: Corumba, lowlands in March; Chapada, in April. The specimen from Chapada is the smaller, but agrees well with the other, except the flagellum is fuscous from the third joint and there is a bluish-green spot on the disk of the mesonotum.

ANASTATUS COREOPHAGUS, Sp. nov.

Female.— Length 2.4 mm. Head gold-green, closely punctate; thorax, except the middle mesothoracic lobe and the metanotum, which are bluish-green, and the abdomen yellowish or honey-yellow; antennæ, except the scape, pedicel and first two or three joints of the funicle, which are yellowish or yellowish-white, black or brown-black; legs yellowish, the tarsi, except the last joint, paler. Front wings, except at base and a transverse band across from the base of the stigmal vein, fuscous, at base and the band hyaline or whitish.

Type.—Cat. No. 7664, U. S. N. M.

Brazil: Pernambuco. Bred June 12, 1883, by Mr. Albert Koebele, from the eggs on an unknown coreid.

ANASTATUS PLEURALIS, Sp. nov.

Female.— Length 2.6 mm. Metallic green, the disk of the mesonotum and the mesopleura anteriorly purplish or bluish-green; the scape, the ridge in front of the tegulæ, the tegulæ, the mesopleura posteriorly, a broad band at base of abdomen, and the legs, except as noted, honey-yellow; the front femora above faintly, a narrow stripe on the middle femora above, the hind femora and tibiæ above, and the basal joint of hind tarsi, are brown or fuscous; the middle coxæ basally and the hind coxæ are metallic. Front wings subfuscous, the basal third and a band across the disk from the middle of the marginal vein, hyaline or whitish.

Brazil: Chapada, in April. One specimen.

ANASTATUS BASALIS, sp. nov.

Female.—Length 4.2 mm. Blue-green; the prothorax, scape and legs, yellowish or pale ferruginous, the middle tibiæ and the hind femora and tibiæ more or less brown or fuscous, the tarsi whitish; abdomen æneous black, with a broad whitish band at base. Front wings with the apical two thirds, except a narrow whitish band across from the marginal vein, fuscous, the basal third hyaline.

Brazil: Chapada, in August. One specimen.

ANASTATUS PUNCTIVENTRIS, sp. nov.

Female.—Length 4 mm. Metallic blue-green, more decidedly green on the disk of the mesonotum anteriorly and on the vertex; the whole body, including the abdomen, is closely punctate. The scape, pedicel, first three or four joints of the flagellum, and a band at the base of the abdomen, are honey-yellow; legs brownish

or fuscous, the front trochanters, a spot on the knees, a stripe on the middle tibiæ beneath and the hind femora beneath, yellowish. The front wings, except the basal third and a narrow transverse band on the disk from near the apex of the marginal vein, are fuscous, the basal third and the narrow transverse band being hyaline or whitish.

Type. — Cat. No. 7662, U. S. N. M.

Brazil: Chapada; Bahia (Mr. A. Koebele).

This is the only species known in this genus with a punctate abdomen. The specimens from Bahia were bred in March, 1883, by Mr. Albert Koebele, from the eggs of an unknown locustid.

Anastatus unifasciatus, sp. nov.

Female.—Length about 5 mm. Dark blue-green, the vertex and disk of the mesonotum more decidedly green; scape yellow, the flagellum, including the pedicel, brown-black, the club with a whitish spot on the oblique truncature; legs dark brown or fuscous, the front and middle tarsi and joints two to four of hind tarsi beneath, yellowish-white. Wings much as in A. basalis.

Brazil: Rio de Janeiro.

Tribe II. Tanaostigmini.

TRICHENCYRTUS Ashmead, gen. nov.

This genus is allied to *Tanaostigmodes* Ashmead, and resembles it in shape, but the body is not bare, as in that genus, but clothed with short, scale-like, white hairs. It is also easily separated by the difference in the antennæ, the scape being subcompressed, the funicle joints one to three being wider than long. In *Tanaostigmodes* the funicle joints are cylindrical and longer than wide.

TRICHENCYRTUS ROBUSTUS, sp. nov.

(Plate XXXVII., Fig. 5.)

Female.—Length 2 mm. Robust, æneous black, with metallic bluish reflections in certain lights, the whole body clothed with short, scale-like white hairs, the head with a white band across the lower part of the face and extending on to the cheeks back of the eyes; there is also another slender white line above this, on each side; extending from the insertion of each antenna to the eye margin; the very short pronotum has a triangular white spot on each side; the front tarsi, or at least more or less beneath, and the short sheaths of the ovipositor, are testaceous. The scape of the antennæ is flat, dilated, æneous black, the flagellum dull black, pubescent, the basal joints wider than long. The wings are hyaline, the costal cell broad, the

veins light brown, the stigmal vein long, ending in a small knob, the postmarginal much shorter than the stigmal.

Brazil: Chapada, in April. One specimen

SUBFAMILY II. ENCYRTINÆ.

TRIBE III. Mirini.

Genus PARENCYRTUS Ashmead.

PARENCYRTUS BRASILIENSIS, sp. nov.

(Plate XXXVII., Fig. 6.)

Parencyrtus brasiliensis Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, p. 368, \mathcal{Q} .

Brazil: Chapada.

Genus ÆNASIUS Walker.

ÆNASIUS CHAPADÆ Ashmead.

(Plate XXXVIII., Fig. 1.)

Ænasius chapadæ Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, p. 371, Q.

Brazil: Chapada.

Genus BOTHRIOTHORAX Ratzeburg.

BOTHRIOTHORAX BRASILIENSIS, sp. nov.

Male. — Length 1.8 mm. Æneous black, the head and thorax with close, thimble-like punctures, sparser on the scutellum; the antennæ are brownish-yellow the first four joints of the flagellum slightly emarginate at apex, with long hairs; the legs are æneous black, the front femora toward apex, the apex of the middle femora, front and middle tibiæ and tarsi, and the hind tarsi, yellowish. Wings hyaline, the veins light brownish, the postmarginal vein only slightly developed. The abdomen in outline is triangular; shorter than the thorax, depressed and æneous.

Brazil: Chapada, in September. One specimen.

Genus HEMENCYRTUS Ashmead.

HEMENCYRTUS HERBERTII Ashmead.

(Plate XXXVIII., Fig. 2.)

Hemencyrtus herbertii Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, p. 375, ♀. Brazil: Chapada, in August and November.

Genus HEXACLADIA Ashmead.

HEXACLADIA SMITHII Ashmead.

Hexacladia smithii Ashmead, Ins. Life, III., 1891, p. 456, ♀♂. — Dalla Torre, Cat.
 Hym., V., 1898, p. 230. — Ashmead, Proc. U. S. Nat. Museum, XXII., 1900,
 p. 377.

Brazil: Chapada, in April.

Genus APHIDENCYRTUS Ashmead.

APHIDENCYRTUS EPYTUS (Walker).

Encyrtus epytus Walker, Monogr. Chalcid., II., 1839, p. 69, ♀. — Dalla Torre, Cat. Hym., V., 1898, p. 258.

Brazil: Bahia.

APHIDENCYRTUS BRASILIENSIS, sp. nov.

Male. — Length 0.8 mm. Æneous black, nearly smooth, the abdomen triangular with a metallic luster; antennæ brownish-yellow, the joints of the funicle oval, with long hairs; legs, except the coxæ and the femora, honey yellow, the coxæ black, the femora brown. Wings hyaline, the veins brown, the stigmal vein about twice as long as the marginal.

Brazil: Chapada, in April. One specimen.

Genus COCCIDENCYRTUS Ashmead.

(?) COCCIDENCYRTUS VITIS Guérin.

Encyrtus vitis Guérin, Iconogr. règne anim., VII., Ins., 1845, p. 416, ♂; T. 67, f. 14.—Dalla Torre, Cat. Hym., V., 1898, p. 265.

Brazil.

SUBFAMILY III. SIGNIPHORINÆ.

Genus SIGNIPHORA Ashmead.

SIGNIPHORA NOACKI Ashmead.

Signiphora noacki Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, p. 410, \(\mathcal{P} \).

Brazil: San Paulo.

Type.—Cat. No. 4793, U. S. N. M.

SIGNIPHORA RHIZOCOCCI Ashmead.

Signiphora rhizococci Ashmead, Proc. U. S. Nat. Museum, XXII., 1900, p. 411, \circ .

Brazil: Minas Geras.

Type.—Cat. No. 4858, U. S. N. M.

FAMILY LXIX. PTEROMALIDÆ.

Subfamily I. Pteromalinæ.

Tribe I. Metaponini.

Genus METOPON Walker.

METOPON BRASILIENSE, sp. nov.

Female.—Length 2 mm. Metallic bronze-green, the head and thorax closely punctate, the abdomen with a brassy tinge, except the flagellum, the antennæ, and

legs, except the coxæ, honey yellow, the flagellum strongly clavate, pale brown, the joints after the second wider than long, the last funicle joint being more than three times as wide as long. The metathorax is almost smooth with a delicate median carina which is forked on the produced neck; no transverse fold on the metanotum. Wings hyaline, the veins yellowish. Abdomen ovate, not longer than the thorax, subcompressed beneath towards apex.

Male.—Length 2.5 mm. Agrees with female in color but easily recognized by the antennæ, the flagellum being long, filiform, the joints of the funicle being briefly pedicellate, with moderately long hairs.

Brazil: Corumba, in May; Santarem. One male and three female specimens.

METOPON MAGNICLAVATUM, sp. nov.

Female.—Length 3 mm. Bronzed black, with a purplish tinge, the head and thorax closely punctate, the abdomen conically pointed, longer than the head and thorax united, æneous black; the scape, pedicel and legs, except coxæ, honey yellow, the flagellum black, the club greatly enlarged and as long as the pedicel and funicle joints united.

Brazil: Santarem. One specimen.

Quite different from all other species known by the greatly enlarged antennal, club and by the conically produced abdomen.

ACANTHOMETOPON Ashmead, gen. nov.

Allied to *Metopon* Walker, but easily separated by the spined scutellum and by the flagellum having only *two* ring-joints.

ACANTHOMETOPON CLAVICORNE, sp. nov.

(Plate XXXVIII., Fig. 3.)

Female.—Length 3.8 mm. Bronzed green, closely punctate, the first six joints of the antennæ and the legs honey yellow, the rest of the antennæ black or brownblack. Abdomen compressed, the ventral valve prominent; above it has a brassy tinge, beneath towards apex and the ventral valve yellow.

Brazil: Corumba, in May. One specimen.

Tribe III. Eutelini.

Genus PLAYTERMA Walker.

PLAYTERMA NEPHELE Walker.

Platyterma nephele Walker, Ann. & Mag. Nat. Hist., XI., 1843, p. 186, 3.

Chile: Coquimbo.

Tribe IV. Pteromalini.

Genus PAPHAGUS Walker.

PAPHAGUS SIDERO Walker.

Paphagus sidero Walker, Ann. & Mag. Nat. Hist., XII., 1843, p. 48, ♀. — Dalla Torre, Cat. Hym., V., 1898, p. 213.

West Indies: St. Vincent.

Genus PTEROMALUS Swederus.

Very few of the hundreds of species described by Francis Walker in this genus belong to it. The types must be studied before his species can be placed in their proper genera.

PTEROMALUS ARCHIA Walker.

Pteromalus archia Walker, Ann. & Mag. Nat. Hist., XI., 1843, p. 116, ♂. — Dalla Torre, Cat. Hym., V., 1898, p. 111.

Chile. This species is now distributed into all parts of the world. It is parasitic on various Aphids and is also occasionally bred from Coccids.

Tribe III. Sphegigasterini.

Genus ACROCLISIS Förster.

ACROCLISIS BRASILIENSIS, sp. nov.

Male.—Length 2.5 mm. Bluish-green, closely punctate; scape, pedicel and legs, except coxe, honey yellow, the femora more or less brownish toward base, the tips of the femora, the tibiæ and tarsi more of a yellowish-white; flagellum filiform, brown, pubescent, the funicle joints more than twice longer than thick; metanotum rugulose, with a median carina; abdomen oblong, the petiole rugulose, opaque, with a delicate carina above, the body of abdomen æneous black, smooth and shiny. Wings hyaline, the veins brownish-yellow.

Brazil: Chapada, in January. One specimen.

SUBFAMILY V. SPALANGIINÆ.

Genus SPALANGIA Latreille.

SPALANGIA BRASILIENSIS, Sp. nov.

Female. — Length 3.1 mm. Æneous black, the tip of hind tibiæ testaceous, the tarsi, except last joint, yellowish-white; eyes pale, hairy. The oblong head is shining but in front with sparse thimble-like punctures and a median grooved line, the cheeks being long and closely opaquely punctured; the pronotum is closely umbilicately punctate, the lobes of the mesonotum are smooth, but posteriorly in front of the scutellum is a median carina formed by two longitudinal rows of coarse punctures; there are also punctures on each side of these rows and coarse punctures in the parapsidal furrows posteriorly; the axillar sutures are coarsely punctured; the scutellum proper is smooth, impunctate, except a transverse row of coarse elongate punctures posteriorly; the metathorax is rugose from coarse pits, while the mesopleura has a large deep median sulcus and a depression filled with elevated lines along the anterior margin. Wings hyaline, faintly dusky, with the veins dark brown.

Brazil: Santarem. One specimen.

FAMILY LXX. ELASMIDÆ.

Genus ELASMUS Westwood.

ELASMUS BRASILIENSIS, Sp. nov.

Female. — Length 2 mm. Blue black, with a yellow line between the scutellum and the postscutellum; thorax above delicately reticulate, finely pubescent, the

scutellum smooth, the head in front, except a few minute punctures, smooth and shining; the scape of the antenne, the coxe apically, the trochanters, front and middle femora, apex of hind femora, and the tibie and tarsi, yellowish-white, the hind tarsi fuscous at apex; the hind femora, except at apex, are bluish; the hairs on the hind tibie are arranged so as to form nine areas; flagellum light brown, the club darker. The abdomen is conically produced, compressed at sides, blue black except towards base beneath, where it is testaceous. Wings hyaline, the tegulæ and the subcostal vein pale yellowish, the rest of the veins brown.

Brazil: Corumba, in May. One specimen.

ELASMUS PERAFFINIS, sp. nov.

Male. — Length 1.8 mm. Blue black with the apex of the scutellum yellow; antennæ, including the branches, brown, the scape yellowish; mandibles and palpi pale; legs yellowish-white, the base of middle and hind coxæ, and a very broad band on their femora, black; the hairs on the hind tibiæ are so arranged as to form six or seven areas. Wings hyaline, the veins light brown, the tegulæ yellowish-white.

Brazil: Exact locality not given. One specimen.

ELASMUS CHAPADÆ, sp. nov.

Female. — Length 2 mm. Blue black, the apex of the scutellum yellow, the basal two segments of the abdomen red; the face is rather closely and distinctly punctate, the thorax reticulately sculptured, the scutellum smooth, shining; antennæ brown black, the scape yellowish; legs blue black except as follows: The front legs, except the coxæ basally, the sutures between the trochanters and femora of middle and hind legs, and the tibiæ and tarsi, are pale yellowish-white, the hind tarsi appear fuscous from the pubescence; the hairs on the hind tibiæ are arranged in two longitudinal rows, the inne row, however, being intersected by a short, cross hair line, forming two long areas. Wings hyaline, the veins brown.

Brazil: Chapada. One specimen.

FAMILY LXXI. EULOPHIDÆ.

SUBFAMILY I. ENTEDONINÆ.

Tribe I. Tetracampini.

No species belonging to this tribe are yet known from South America.

Tribe II. Omphalini.

Genus OMPHALE Haliday.

OMPHALE BRASILIENSIS, sp. nov.

Female.—Length 2 mm. Blue, the thorax with an æneous tinge; a dot on the front and middle knees, the extreme apex of all tibiæ and the tarsi, except the last joint, pale yellowish-white; mandibles pale; antennæ brown black, pubescent, the scape yellowish. Wings hyaline, bare or nearly, the veins pale, the postmarginal vein hardly developed, shorter than the very short stigmal vein. The abdomen is conically pointed, subcompressed beneath at base, and a little longer than the head and thorax united.

Brazil: Chapada, in April; Corumba, in May.

This species is allied to O. nigrocyanea Ashm. described from Grenada, W. I.

Genus CLOSTEROCERUS Westwood.

CLOSTEROCERUS CERCIUS Walker.

Closterocerus cercius Walker, Ann. & Mag. Nat. Hist., XI., 1843, p. 31, Q.

Closterocerus pelor Walker, Ann. & Mag. Nat. Hist., XI., 1843, p. 185, 3.

Entedon pelor Walker, List. Chalc. Brit. Museum, I., 1846, p. 62.—Spinola, Gay: Hist. de Chile, Zool., VI., 1851, p. 436, J.—Dalla Torre, Cat. Hym., V., 1898, p. 42.

Chile: Isle of Chonos.

CLOSTEROCERUS XENODICE Walker.

Closterocerus xenodice Walker, Ann. & Mag. Nat. Hist., X., 1843, p. 273, Qd.

Entedon xenodice Walker, List. Chalc. Brit. Museum, I., 1846, p. 62.—Spinola, Gay: Hist. de Chile, Zool., VI., 1851, p. 436, & J.—Dalla Torre, Cat. Hym., V., 1898, p. 45.

Chile: Valdivia.

TRIBE III. Entedonini.

UROENTEDON Ashmead, gen. nov.

This genus is based upon one of the most striking yet discovered in the sub-family Entedoninæ. It is easily recognized by the long, compressed abdomen which terminates in a long ovipositor, and has the hypopygium prominent, acutely plow-

share-shaped; by the very long, ten-jointed antennæ, with two ring-joints, the funicle joints being globosely swollen towards base, with whorls of long hairs somewhat as in the males in the genera *Hoplocrepis* and *Lophocomus*; and by the wings, which are fringed, the marginal vein being very long, the stigmal vein short, while the post-marginal vein is long. The male is unknown.

UROENTEDON VERTICELLATUS, sp. nov. (Plate XXXVIII., Fig. 4.)

Female. — Length 3 mm.; ovipositor as long as the abdomen. Highly polished, impunctate, the head, the prothorax beneath and the legs, honey yellow, the face with a greenish metallic luster; antennæ black, except the long slender scape which is yellowish at its basal half; thorax bottle blue, the axillæ faintly testaceous towards the sutures anteriorly at the sides, the scutellum and the mesopleura æneous black; abdomen black, the tip æneous, the extreme base bluish. Wings hyaline, fringed, the veins yellowish.

Brazil: Chapada, in September. One specimen.

Genus HOPLOCREPIS Ashmead.

HOPLOCREPIS BIFASCIATA, sp. nov.

(Plate XXXVIII., Fig. 5.)

Male. — Length 1.7 mm. Æneous black, the occiput, the metathorax, the petiole of abdomen and the legs mostly testaceous, the trochanters, the extreme base of the femora and the tarsi pale yellowish, the femora and tibiæ brown, the hind tibiæ, except at base and tips, black; the lateral lobes of the mesonotum are brownish; while the body of the abdomen is small, spatulate, black.

The ten-jointed antennæ are black with the scape and pedicel yellowish; the joints of the funicle are long, nodose-pedicillate, with whorls of long hairs, the first, second and third joints with a short branch above. Wings hyaline, the front wings with two transverse fuscous bands, the first band very narrow, situated a little before the basal third, the other broad, extending across the wing from the apical middle of the marginal vein and enclosing the stigmal vein.

Brazil: Chapada. One specimen.

Differs from all other males in this genus by having short branches on funicle joints one, two and three.

HOPLOCREPIS BRASILIENSIS, sp. nov.

Female. — Length 1.6 mm. Brownish-yellow with the collar anteriorly, the mesopleura, the metanotum, the petiole and the body of abdomen above, fuscous or brownish-black. The antennæ are black with the scape yellowish; legs flavo-tes-

taceous, the hind femora medially and the hind tarsi fuscous. Wings banded as in H. bifasciata.

Brazil: Santarem. One specimen.

EULOPHOPTERYX Ashmead, gen. nov.

This genus comes nearest to *Lophocomus* Haliday, agreeing with it in all characters except the antennæ. The antennæ are ten-jointed, as in *Lophocomus*, but the joints of the funicle are longer than thick, cylindrical, loosely joined, not pedicellate nor compressed, with the club black or brown black, not white. In *Lophocomus* the funicle joints are distinctly although briefly pedicellate, compressed, two or three wider than long, while the club is white or yellowish-white.

EULOPHOPTERYX CHAPADÆ, sp. nov.

(Plate XXXVIII., Fig. 6.)

Female.—Length 1.5 mm; robust, æneous black, impunctate, except the pronotum, which is distinctly punctured; the scape, the pedicel and the legs, except as hereafter noted, are honey yellow; flagellum brown black, the front and middle femora and the base of their tarsi are metallic brown. The front wings are hyaline, with a subfuscous cloud on the disk, the veins yellowish. The abdomen is broadly oval, petiolate, not longer than the thorax, above depressed, beneath subconvex.

Brazil: Chapada, in August. One specimen.

Genus LOPHOCOMUS Haliday.

LOPHOCOMUS ANAITIS (Walker).

Cirrospilus anaitis Walker, Monogr. Chalc., II., 1839, p. 91, Q.

Lophocomus anaitis Haliday, Trans. Ent. Soc. London, III., 1843, p. 297.—Spinola, Gay: Hist. de Chile, Zool., VI., 1851, p. 432, \(\varphi \).—Dalla Torre, Cat. Hym., V., 1898, p. 70.

Bellerus anaitis Walker, Ann. & Mag. Nat. Hist., XI., 1843, p. 32, &.— Spinola Gay: Hist. de Chile, Zool., VI., 1851, p. 429, &.— Dalla Torre, Cat. Hym., V., 1898, p. 26.

Chile: Conception; Isle of Chiloe.

LOPHOCOMUS CYANEUS, sp. nov.

Female.— Length 1.6 mm. Dark blue, with æneous reflections, the middle lobe of the mesonotum and the inner margins of the lateral lobes, æneous; antennæ, except the club, which is yellowish-white, black: legs honey yellow, with the hind tibiæ

fuscous, the hind coxæ and trochanters somewhat whitish; abdomen beneath rufopiceous. Wings subhyaline with a large subfuscous discoidal cloud.

Brazil: Santarem. One specimen.

Genus HORISMENUS Walker.

HORISMENUS CLEODORA Walker.

Horismenus cleodora Walker, Ann. & Mag. Nat. Hist., XI., 1843, p. 31, ♀. Entedon cleodora Walker, List Chalc. Brit. Museum, I., 1846, p. 66.—Dalla Torre,

Cat. Hym., V., 1898, p. 35.

Peru: Lima.

TABLE OF NEW SPECIES.

Horismenus bisulcus, sp. nov.

Female.—Length 2.4 mm.; above metallic greenish, the prothorax at the sides, the mesopleura and the coxæ blue, the abdomen black; the scape of the antennæ, except at apex, and the legs, except coxæ, are pale yellowish or yellowish-white. The head and the thorax, except the metanotum, are mostly scaly punctate or punctate, the metanotum being smooth and shining, with two broad longitudinal sulci, extending from base to apex. Wings hyaline, the veins pale yellowish. The abdomen is shorter than the thorax, short ovate, the terminal segments retracted within the large second segment which occupies most of the whole surface; the petiole is opaque, furrowed and a little longer than thick.

Brazil: Chapada, in April.

Horismenus brasiliensis, sp. nov.

Female.—Length 1.6 mm.; æneous black, with a bluish tinge on the parapsidis and at the sides of the thorax, the metathorax being brassy; the legs, except the

coxæ, the femora and the last joint of the tarsi, are yellowish-white, the coxæ, the femora except at apex and the abdomen, are dark blue, the last joint of the tarsi being black or brown. The metanotum is smooth, with two longitudinal sulci. The abdomen is ovate, not longer than the thorax, the second segment occupying hardly half its whole surface, the following segments short, nearly equal.

Brazil: Rio de Janeiro, in August.

Horismenus corumbæ, sp. nov.

Female.—Length 2 mm. Æneous black, the thorax smooth except the middle mesothoracic lobe; the legs, except the coxe, are honey yellow, with the knees, tips of tibæ and the tarsi yellowish white. The abdomen is conically pointed, a little longer than the head and thorax united, the second segment being very long, occupying two thirds the whole surface.

Brazil: Corumba, in February.

HORISMENUS PERSIMILIS, sp. nov.

Female.—Length about 0.9 mm. Mostly blue, the scutellum with a decided æneous tinge; flagellum brown black, pubescent; scape and legs, except as hereafter noted, honey yellow, the knees, tips of tibiæ and the tarsi whitish. The abdomen is ovate, not longer than the thorax, the second segment occupying more than half the whole surface.

Brazil: Chapada, in April.

Horismenus Æneicollis, sp. nov.

Female.—Length 1.6 mm. Mostly blue, the pronotum above and the metanotum æneous or metallic greenish, the scape of the antennæ and the legs, except the coxæ, honey yellow. The abdomen is ovate, a little longer than the thorax, the second segment occupying hardly half the whole surface.

Brazil: Santarem.

PELOROTELUS Ashmead, gen. nov.

Allied to *Pleurotropis* Förster, but easily separated by the absence of the lateral metathoracic carinæ, by the metathorax being produced into a long neck at apex and by the abdomen, which is very lengthy-petiolated, the petiole being about as long as the hind femora.

The head is very wide, sublenticular, seen from in front wider than long, the occiput concave; the antennæ are ten-jointed, with one ring-joint, the scape clavate, the pedicel obconical, not much longer than wide at apex, the funicle joints oblong, about thrice as long as thick, briefly pedunculate at apex, clothed with rather long

hairs; the front wings have the marginal vein long, the stigmal vein short, the post-marginal vein not developed; otherwise it is similar to *Pleurotropis*.

PELOROTELUS CŒRULENS, sp. nov.

Male.—Length 1.8 mm. Dark blue, the head and thorax reticulately punctured-the middle mesothoracic lobe and the lateral ridges of the metanotum with a metal, lic greenish tinge; a spot on the knees, extreme apices of tibiæ and the tarsi are yellowish-white; mandibles testaceous. The antennæ are rather long, ten-jointed, the scape elongate, the funicle four-jointed, the joints rather long, loosely joined, with sparse, moderately long hairs, the last joint being fully thrice as long as thick at the middle, the club three-jointed, longer than the first joint of the funicle, the last joint being represented by a little spur. The abdomen is clavate, the petiole, which is attached to the long neck of the metathorax, very long, shagreened, the body smooth and polished. Wings hyaline, the veins pale yellowish.

Brazil: Santarem, in April. One specimen.

Genus ENTEDON Dalman.

ENTEDON ANTANDER Walker.

Entedon antander Walker, Monogr. Chalc., II., 1839, p. 70, J. — Dalla Torre, Cat. Hym., V., 1898, p. 33.

Genus DEROSTENUS Westwood.

DEROSTENUS ALCESTAS Walker.

Derostenus alcestas Walker, Ann. & Mag. Nat. Hist., XI., 1843, p. 31, 3.

Entedon alcestas Walker, List Chalc. Brit. Museum, I., 1846, p. 137.—Spinola, Gay: Hist. de Chile, Zool., VI., 1851, p. 437, J.—Dalla Torre, Cat. Hym., V., 1898, p. 32.

Chile: Conception.

Tribe IV. Pediobiini.

PARACRIAS Ashmead, gen. nov.

A genus allied to *Acrias* Walker. Form short and robust, the thorax coarsely reticulately sculptured, the head highly polished, impunctate in front.

The head is very wide, lenticular, wider than the thorax and very thin anteroposteriorly, the occiput concave; the eyes are large, ovate, the malar space short but distinct; the antennæ are nine-jointed, with a ring-joint, the funicle four-jointed, the joints oblong oval, briefly peduncled, hairy, the club two-jointed, the last joint represented by a spur; the thorax is shaped as in *Entedon* but without parapsidal furrows, the metathorax being produced into a neck at apex, with a delicate median carina; the abdomen is ovate or conic-ovate, distinctly petiolate, the second segment (first body segment) being very long, occupying most of the surface, the following segments very short, apparently capable of being retracted.

PARACRIAS LATICEPS, sp. nov.

(Plate XXXIX., Fig. 1.)

Female.—Length 1.6–1.8 mm. Æneous black, the thorax with a greenish tinge above, and coarsely reticulately sculptured, the coxæ and legs bluish, the trochanters, a spot on the knees, the extreme apex of tibiæ, and the tarsi yellowish-white. Wings hyaline, the veins yellowish, the postmarginal vein hardly developed, the stigmal vein very short, its knob subsessile. The metathorax is contracted into a

neck at apex and punctate. The abdomen is petiolate, the body in one specimen is conic-ovate, pointed at apex, in another specimen short oval, the terminal segments in the latter evidently being retracted within the very large second segment which occupies nearly the whole surface of the abdomen.

Brazil: Chapada, in August and September.

URODEROSTENUS Ashmead, gen. nov.

This genus is based upon a species from St. Vincent, W. I., and is easily recognized by the strongly exserted ovipositor and by the wings having a long marginal fringe, as in some Mymarids.

AMETALLON Ashmead, gen. nov.

This genus comes very close to *Chrysonotomyia* Ashmead, but is easily recognized by its non-metallic color, and by the very short stigmal vein. The antennæ are nine-jointed, with one ring-joint, the flagellum being filiform, tapering off towards apex, clothed with sparse hairs, the funicle being three-jointed. The abdomen is long, conic-ovate.

AMETALLON CHAPADÆ, sp. nov.

Female.— Length 1.4 mm. Honey yellow, the abdomen mostly of a brownish-yellow, with a transverse fuscous band a little before the middle; eyes brown; antennæ filiform, the flagellum tapering off to a point at apex, with long, sparse hairs. Wings hyaline, fringed, the veins yellowish, the marginal vein very long, fully twice the length of the submarginal, the stigmal vein short but with its knob petiolate, and longer than the postmarginal. The abdomen is conicovate, a little longer than the head and thorax united and ends in a short ovipositor.

Brazil: Chapada, in April. Two specimens.

SUBFAMILY II. APHELININÆ.

Genus ASPIDIOTIPHAGUS Howard.

Aspidiotiphagus citrinus (Craw).

Coccophagus citrinus Craw, Destructive Insects, Sacramento, Cal., 1891.

Aspidiotiphagus citrinus Howard, Insect Life, Vol. VI., 1891, p. 234.—Howard,

Lechn. Series, No. 1, U. S. Dept. Agric., p. 31, f. 10.—Dalla Torre, Cat. Hym., V., 1898, p. 224.

Brazil: Bahia, March, 1883 (Albert Koebele).

SUBFAMILY III. TETRASTICHINÆ.

Tribe I. Ceratoneurini.

This tribe is at present known only from Mexico and the West Indies, but representatives will undoubtedly be discovered in South America.

Tribe II. Tetrastichini.

Genus TRICHOPORUS Förster.

TRICHOPORUS COLLIGUAYA (Philippi).

Exurus colliguaya Philippi, Stettin. ent. Zeitg., XXXIV., 1873, p. 296; T. 1.—Dalla Torre, Cat. Hym., V., 1898, p. 159.

Chile.

TRICHOPORUS MELLEUS, sp. nov.

Female.—Length 1.8 mm. Honey yellow, punctate, the eyes brown, the abdomen with a blackish spot on each side near the middle, the scape and legs pale yellowish; flagellum long, filiform, hairy; wings hyaline, the veins pale yellowish. The abdomen is cylindrical, pointed at apex and as long as the head and thorax united.

Male. — Length 1.4 mm. Agrees in color with the female except that the blackish spots near the middle of the abdomen unite and form a transverse band, while the veins in the front wings are brownish. The flagellum is long and the hairs are much longer than in the female.

Brazil: Santarem; Chapada.

TRICHOPORUS VIRIDICYANEUS, sp. nov.

Female.— Length 2–2.6 mm. Metallic bluish-green to blue, punctate; scape, trochanters, apices of all femora, and all tibiæ and tarsi, except the last joint, pale yellowish; flagellum brownish-yellow, pubescent; wings hyaline, the veins yellowish. The abdomen is long, cylindrical, twice as long as the thorax, pubescent, the first and second body segments about equal, shorter than the third, the first segment longer than the third, the sixth and seventh short, the seventh conical.

Male. — Length 1.4–1.5 mm. Agrees well with the female, except in the usual sexual differences and in a slight difference in the color of the antennæ and legs: The flagellum is darker with longer hairs and with only one ring-joint, while the front and middle femora are dusky only at base. The abdomen is cylindrical, a little longer than the head and thorax united.

Brazil: Chapada, in April. Fourteen females, six male specimens.

TRICHOPORUS PERSIMILIS, sp. nov.

Female.—Length 2.8 mm. Metallic brown black, punctate, the abdomen brown beneath; flagellum brown, hairy; scape, pedicel and legs, including the coxe, honey yellow, the femora more or less dusky or brownish, especially basally; otherwise it is very similar to *T. viridicyaneus* except that the first body segment of the abdomen is twice the length of the second.

Brazil: Chapada, in April. Two specimens.

Genus TETRASTICHUS Haliday.

TETRASTICHUS ARCHIDEUS (Walker).

Tetrastichus xenocles Walker, List Chalc. Brit. Museum, I., 1846, p. 81.—Spinola, Gay: Hist. de Chile, Zool., VI., 1851, p. 427, \(\text{\Pi} \).—Dalla Torre, Cat. Hym., V., 1898, p. 25.

Chile: Chiloe.

TABLE OF NEW SPECIES.

TETRASTICHUS ALBITARSIS, sp. nov.

Female.—Length 1.5 mm. Wholly dark blue, except the parapsides which are zeneous, the base of the antennal scape which is honey yellow, and the tarsi which are yellowish-white except the last joint. The insect is smooth impunctate, except the head which has a few minute punctures on the face; otherwise I can detect no distinct sculpture, although under a very high power the thorax above appears feebly shagreened. Wings hyaline, the veins brown. Abdomen conic-ovate, little longer than the head and thorax united, smooth and shining, depressed above, subcarinate beneath towards base. The flagellum is broken off at the pedicel and cannot be described in detail.

Brazil: Rio de Janeiro, in August. One female specimen.

TETRASTICHUS CHAPADÆ, sp. nov.

Female.—Length 1.8 mm. Æneous black, the mesonotum and scutellum with a metallic greenish tinge, shagreened, the head punctate in front; scape, pedicel and legs, except coxæ, honey-yellow, the femora faintly dusky basally; flagellum brown, pubescent, the first joint of the funicle is the largest, more than twice longer than thick. The middle lobe of the mesonotum has two rows of punctures on each side, along the parapsidal furrows. The metanotum is punctate and has a distinct median carina. The wings are hyaline, the veins yellowish. The abdomen is conicovate, smooth impunctate and about the length of the thorax, the first body segment being the longest.

Brazil: Chapada, in April. One female specimen.

TETRASTICHUS BRASILIENSIS, sp. nov.

(Plate XXXIX., Fig. 2.)

Female. — Length 2 mm. Dark blue black, nearly black, with a faint æneous tinge, the head except in the scrobes with thimble-like punctures, the thorax above shagreened, the middle lobe of the mesonotum with a single row of punctures along the parapsidal furrows; scape and legs, except coxæ, honey yellow, the femora

more or less dusky medially, the tarsi paler yellowish. Wings hyaline, the veins yellowish. Abdomen conically pointed, longer than the head and thorax united, depressed above, convex beneath towards base.

Brazil: Chapada, in January. One female specimen.

TETRASTICHUS INCONGRUUS, Sp. nov.

Female.—Length 1.5 mm. Black, the head smooth, shining, except some minute punctures, in front near the eyes, the thorax microscopically shagreened, without a row of punctures along the parapsidal furrows; scape and legs, except the coxæ honey-yellow, the femora a little darkened. Wings hyaline, the veins yellowish. The abdomen, as seen from above, is rounded, as in the genus Syn

Förster, shorter than the thorax; beneath it is carinate.

Brazil: Santarem. One female specimen.

SUBFAMILY IV. ELACHERTINÆ.

TRIBE I. Euplectrini.

Genus EUPLECTUS Westwood.

TABLE OF SPECIES.

1.	Eneous black.
	All coxæ yellowish-white
	Hind coxæ black.
	Legs, except the hind coxae and the hind femora, honey yellow, the hind femora brownish
	at the thickened portion. Female: E. brasiliensis.
2.	Legs yellowish-white.
	Antennæ wholly pale yellow or with the flagellum wholly brown
	Antennæ not wholly pale yellow, the six last joints brown; basal half of abdomen beneath and
	above, testaceous, the apical half black, as well as a streak at sides basally; clypeus and malar
	space black
3.	Antennæ wholly pale yellowish; scutellum basally purplish; metallic green apically; a triangular area
	at base of metanotum connected with a median carina; body of abdomen rufous basally; elypeus
	reddish; malar space black. Male
	Antennæ not wholly pale, the pedicel and flagellum brown; scutellum wholly black; clypeus and
	cheeks testaceous; body of abdomen beneath, except just at apex, and above basally, rufous.
	Male

EUPLECTRUS BRASILIENSIS, Sp. nov.

Female.—Length 1.6 mm. Æneous black, the head and thorax with long, sparse hairs; clypeus honey yellow; antennæ, except faintly toward apex, and the legs, except the hind coxæ and the hind femora, honey yellow, the hind coxæ black, the hind femora more or less brownish except at base. Wings hyaline, pubescent, the tegulæ and the veins pale yellowish. The abdomen is black, with a

reddish spot basally both above and beneath, the petiole shagreened. The joints of the funicle are long, the last joint being fully thrice as long as thick.

Brazil: Porto Branca, in April. One specimen.

EUPLECTRUS CORUMBÆ, sp. nov.

Female.— Length 1.5 mm. Æneous black, the clypeus black; first three joints of antennæ and the legs, including all coxæ, pale honey yellow or yellowish-white; rest of antennæ brown; basal half of abdomen beneath and above testaceous; otherwise hardly distinguishable from E. brasiliensis, except that the last three joints of the funicle are much shorter than in that species, being only a little longer than thick.

Brazil: Corumba, in May. One specimen.

EUPLECTRUS SOLITARIUS, Sp. nov.

Male.—Length 2 mm. Æneous black, the clypeus testaceous; antennæ and legs, including coxæ, yellowish-white; body of abdomen rufous at basal half above and with a small spot of the same color beneath; the petiole is more than twice as long as thick, shagreened.

Brazil: Rio de Janeiro, in November. One specimen.

EUPLECTRUS CHAPADÆ, sp. nov.

Male.— Length 1.6 mm. Æneous black, the clypeus and the cheeks testaceous; flagellum, including the pedicel brown; scape of antennæ and the legs, including all coxæ, yellowish-white; body of abdomen, except apically and a streak along the sides, rufous or testaceous.

Brazil: Chapada, in April. Two specimens (one badly broken).

TRIBE II. Ophelinini.
Genus ARDALUS Howard.

ARDALUS HOWARDII, Sp. nov.

Male. — Length 1.3 mm. Black; the mandibles and the flagellum are testaceous; the trochanters, base and tips of femora, base of hind tibiæ, and rest of the legs pale yellowish, the femora, except as noted, and the apical two thirds of the hind tibiæ being brown or brown black. The head is smooth, impunctate, the eyes grayish-brown, pubescent, the ocelli red; flagellum filiform, tapering off towards apex, the funicle joints loosely joined, the last fully twice longer than thick, the preceding joints a little longer. The thorax is rather coarsely rugulose, the metathorax polished, with two median carinæ and some wrinkles on each side. Wings hyaline,

with a faint discal spot beneath the apex of the stigmal vein, the veins pale yellowish. The abdomen in outline is nearly round, depressed, the petiole long, smooth and shining, the first and second body segments occupy half the whole surface, the second the larger, the following short, about equal.

Brazil: Chapada, in May. One specimen. Named in honor of Dr. L. O. Howard.

Genus LEUCODESMIA Howard.

LEUCODESMIA FLAVICEPS, sp. nov.

Female. — Length 2.3 mm. Head yellow, the eyes brown, pubescent; thorax and abdomen black; scape and the legs, except coxe and the front femora medially, honey yellow, the coxe black, the front femora medially brownish; flagellum brown black, subcompressed, the joints of the funicle loosely joined, the first joint the longest, about twice as long as wide, the last joint only a little longer than wide. The head is smooth impunctate, except a slight shagreening on the frons above; the thorax is scaly punctate, the metanotum being smooth, with a median carina. Wings hyaline, the veins yellowish. The abdomen is ovate, depressed, not longer than the thorax.

Brazil: Chapada, in April. One specimen.

ELACHERTOMORPHA Ashmead, gen. nov.

This genus resembles *Elachertus* Spinola, and could be easily mistaken for it, except that the hind tibiæ have *two* apical spurs. From *Leucodesmia* Howard, it is separated by the antennæ being ten-jointed and by having the scutellum grooved.

ELACHERTOMORPHA FLAVICEPS, sp. nov.

Female.—Length 1.5 mm. Head, except the eyes and two converging black lines on the scrobes, honey yellow; thorax and abdomen æneous black, the former shagreened, with the scutellum rugulose and the metanotum carinate; scape of autennæ and the legs, except as noted, honey yellow, the middle and hind coxæ black, the front and middle femora basally, more or less dusky, the hind femora medially and the apex of the hind tibiæ brownish. Wings hyaline, the veins yellowish. The abdomen is rounded, smooth and shining, shorter than the thorax, with a short petiole.

Brazil: Santarem. One specimen.

SYMPIESOMORPHA Ashmead, gen. nov.

This genus has the general habitus of *Sympiesis* Förster, with which I at first confused it, but one may easily distinguish it by the *two* spurred hind tibiæ and by the

distinct parapsidal furrows. It also resembles *Stenomesius* Westwood but is easily separated by the pubescent eyes, and by the longer and more sessile abdomen.

SYMPIESOMORPHA BRASILIENSIS, sp. nov.

Female.—Length 3 mm. Black; the abdomen is æneous black, with a large rufous spot at base both above and beneath; scape and legs, including the coxæ, honey yellow, the tips of the coxæ and the trochanters whitish; flagellum black. Wings hyaline, the tegulæ and veins pale yellowish. The head is smooth, with a few minute punctures in front; thorax reticulately punctate, clothed with whitish hairs, the metanotum with a sharp median carina. The abdomen is ovate, depressed, about as long as the head and thorax united.

Brazil: Chapada, in September. One specimen.

SYMPIESOMORPHA OBSCURA, sp. nov.

Female.—Length 1.8 mm. Black with a bluish tinge, the head in front and the metapleura metallic greenish, the abdomen æneous black, the dorsum with a yellowish band before the middle, the base before the band being blue, the venter with a yellowish spot near the middle; the scape and legs, except the coxæ and most of the femora, are pale yellowish or yellowish-white; flagellum black. Wings hyaline, the veins yellowish.

Brazil: Corumba. One specimen.

Genus STENOMESIUS Westwood.

STENOMESIUS DIMIDIATUS, sp. nov.

(Plate XXXIX., Fig. 3.)

Female.—Length 2.1 mm. Flavo-testaceous, the head in front below pale yellowish, the scutellum subfuscous, the metathorax and apical half of the abdomen black; scape and legs, including the coxæ, pale yellowish; wings hyaline, the front pair with a fuscous spot from the apex of the stigmal vein. The head is smooth, the thorax, and especially the middle mesothoracic lobe, is rugulose, the scutellum coriaceous, the furrows with large punctures; the metanotum has a sharp median carina and is transversely regulose on each side. The abdomen is ovate, smooth and polished, except the petiole, which is finely rugulose.

Brazil: Chapada. One specimen.

ALOPHUS Ashmead, gen. nov.

This genus falls in between *Diglyphomorpha* Ashm. and *Sympicsis* Först.; it comes nearest to the first mentioned but differs in not being metallic, by having ten-jointed

antennæ, and by having only two dorsal grooved lines on the scutellum. In *Sympiesis* the antennæ are ten-jointed, but it is metallic and the scutellum is without dorsal grooved lines.

ALOPHUS BRASILIENSIS, Sp. nov.

Female.—Length 2.8–3 mm. Honey yellow, the eyes brown, the flagellum and the apex of the abdomen above, black, the legs yellowish, the tarsi whitish, the apical half or more of hind tibiæ sometimes fuscous. Wings hyaline, with a fuscous cloud beneath the stigmal vein.

The abdomen is long, conical, depressed above, convex beneath, usually considerably longer than the head and thorax united, black or blackish at apex above.

Male.—Length 2 mm. Head, except the clypeus, the lower part of the cheeks and the mouth parts, black, the thorax honey yellow, with the disk of the scutellum, the mesopleura and the metathorax black; flagellum light brown; scape and the legs pale yellowish. The abdomen is oblong, briefly petiolate, depressed, about the length of the thorax, the basal part of the dorsum yellowish.

Brazil: Chapada, in April; Rio de Janeiro, in September.

Tribe III. Elachertini.

Genus ELACHERTUS Spinola.

ELACHERTUS CATTA (Walker).

Eulophus catta Walker, Monogr. Chalc., II., 1839, p. 71, ♀.

Elachestus catta Walker, List Chalc. Brit. Museum, I., 1846, p. 69.

Elachistus catta Dalla Torre, Cat. Hym., V., 1898, p. 77.

Brazil: Bahia.

ELACHERTUS GYES (Walker).

Eulophus gyes Walker, Monogr. Chalc., II., 1839, p. 89, 3.

Elachestus gyes Walker, List Chalc. Brit. Museum, I., 1846, p. 69.

Elachistus gyes Dalla Torre, Cat. Hym., V., 1898, p. 78.

Chile: Isle of Chiloe.

SUBFAMILY V. EULOPHINÆ.

TRIBE I. Eulophini.

Genus SYMPIESIS Förster.

Genus EULOPHUS Geoffroy.

EULOPHUS? LAONOME Walker.

Eulophus laonome Walker, Monogr. Chalc., II., 1839, p. 90, ♀.—Spinola, Gay: Hist. de Chile, Zool., VI., 1851, p. 431, ♀.—Dalla Torre, Cat. Hym., V., 1898, p. 62.

Chile: Isle of Chiloe.

EULOPHUS RHIANUS Walker.

Eulophus rhianus Walker, Ann. & Mag. Nat. Hist., X., 1842, p. 116, ♀.— Spinola, Gay: Hist. de Chile, Zool., VI., 1851, p. 430, ♀.— Dalla Torre, Cat. Hym., V., 1898, p. 67.

Chile: Valparaiso.

FAMILY LXXII. TRICHOGRAMMIDÆ.

Genus PENTARTHRON Riley.

PENTARTHRON BRASILIENSIS, sp. nov.

Female.—Length 0.4 mm. Head and thorax above uniformly honey-yellow, the temples, cheeks, mouth parts, sides of thorax and the abdomen beneath yellow-ish-white, the eyes brown; the antennæ, except the club which is dusky, and the legs are very pale or yellowish-white; the pedicel is hardly longer than thick, much shorter than the first joint of the funicle which is conical and more than twice olnger than thick at apex, the second funicle joint being small, annular, the club large, fusiform, as long as the scape. The wings are hyaline, with a long marginal fringe, the front wings with the pubescence arranged in eight hair lines.

Type.—Cat. No. 6596, U. S. N. M.

Brazil: Bahia. Taken on cotton, March, 1883, by Mr. Albert Koebele.

FAMILY LXXIII. MYMARIDÆ.

SUBFAMILY I. GONATOCERINÆ.

I have seen no representative of this subfamily from South America, although it must be well represented by many species in several genera.

SUBFAMILY II. MYMARINÆ.

Genus POLYNEMA Haliday.

POLYNEMA BRASILIENSIS, sp. nov.

Female.—Length 1 mm.; ovipositor about one third the length of the abdomen. Polished black; antennæ brownish-fuscous, with the scape, pedicel, first joint of funicle, the apex of the fourth and base of fifth funicle joints, yellow; the legs except as noted, and the abdominal petiole pale yellow, the hind femora toward apex and the apical two fifths of the hind tibiæ, dusky or fuscous.

Brazil: Chapada, in April. One specimen.

POLYNEMA RUFESCENS, sp. nov.

Male.—Length 0.8 mm. Reddish-brown, the eyes and the flagellum brown black; scape, pedicel and legs, except the hind tibiæ which are fuscous, honey yellow; the abdomen towards the apex is tinged with fuscous.

Type.—Cat. No. 6595 U. S. N. M.

Brazil: Pernambuco, February, 1883 (Mr. A. Koebele).
